

Addressing Malnourishment - Is RUTF Effective?

What is the issue?

\n\n

\n

- 'Ready-to-Use Therapeutic Food - RUTF' is being pushed by some as a solution for malnutrition.

\n

- But India has largely been critical and 'Ministry of Women & Child Development' recently clarified that RUTF is not an official policy.

\n

\n\n

How severe is malnutrition in India?

\n\n

\n

- The Global Hunger Index report 2017 put India at number 100 in a list of 119 countries.

\n

- National Family Health Survey-4 (2015-16) found 35.7% children aged less than 5 years were underweight, and 38.4% were stunted.

\n

- There is consensus on large scale intervention to address this but there are several differences on the appropriate approach.

\n

\n\n

What is RUTF?

\n\n

\n

- RUTF is also referred to as 'Energy Dense Nutritious Food - EDNF' due to its high calorific value.

\n

- It is a medical intervention to improve the nutrition intake of children suffering from Severe Acute Malnutrition (SAM).

\n

- It is a packaged paste of peanuts, oil, sugar, vitamins, milk powder and mineral supplements containing 520-550 kilocalories of energy per 100g.
\n
- Additional ingredients may include nuts, legumes, grains and sweeteners to improve the taste.
\n
- Usually, it is given to children aged between six months and six years, after a doctor's prescription.
\n
- A child can be given three packets daily for a month and each packet which costs around Rs 25 and has a shelf life of two years.
\n

\n\n

Where is it being predominantly used?

\n\n

- RUTF use is common in Africa, where the incidence of malnutrition among children is high.
\n
- In India, the global collaborative 'Scaling Up Nutrition' movement has tied up with Maharashtra, Uttar Pradesh and Jharkhand to promote therapeutic food.
\n
- Pilot projects to treat severely malnourished children with RUTF have been undertaken in all three states and in Bihar.
\n

\n\n

What is Indian government's take?

\n\n

- Government maintains that enough evidence is not available to substantiate the benefits of RUTF vis-à-vis other interventions.
\n
- A joint assessment done by 'Department of Biotechnology, Indian Council of Medical Research and the Health Ministry' found RUTF to be only temporarily helpful.
\n
- The Centre had even asked various state governments to stop distributing RUTF packets to malnourished kids.
\n

- Maharashtra, which was planning to distribute 32crores worth RUTF through anganwadis has asked for reconsideration.

\n

\n\n

What are the demonstrated benefits of RUTF?

\n\n

\n

- A study in Mumbai's Sion Hospital put RUTF's efficacy at 65-70%.
- The United Nations Children's Fund (UNICEF) supports community-based management along with RUTF.
- UNICEF notes that RUTF is safe, cost-effective and has saved the lives of hundreds of thousands of children.
- Out of the 20 million children worldwide suffering from acute malnutrition, about 10-15% received treatment through RUTF.
- India is one of 16 countries where local manufacturers of RUTF are being given UNICEF accreditation.

\n

\n\n

What are the opposing views?

\n\n

\n

- The concept of therapeutic food has long been debated in India.
- Debates in essence, revolve around concerns over whether RUTF would be effective in India, considering its varying food habits.
- **Traditional Food** - Some studies have shown that children who were given RUTF found it too heavy to eat anything else afterward.
- There are concerns that RUTF may replace nutritional best practices and family foods that children would normally be eating.
- Also, this might encourage discontinuing breastfeeding in children older than six months.
- **Temproary Solution** - A slip back to malnutrition once RUTF was stopped

\n

was also noticed in a considerable number of cases.

\n

- While there is no largescale study of post-RUTF treated children in India so far, health activists say it cannot be a permanent solution

\n

- **Financial Burden** - RUTF is a medical intervention, and at Rs 25 per packet, a single child's treatment will cost Rs 2,250 a month.

\n

- As over a third of all children aged under five years are stunted or underweight, RUTF will require massive financing.

\n

\n\n

How else can the problem be addressed?

\n\n

\n

- The Health Ministry is working to develop guidelines and a toolkit for early childhood development.

\n

- This is to better equip frontline workers for counseling families on nutrition and feeding practices.

\n

- Family-centric approach instead of food-centric approach for handling malnutrition is being mooted.

\n

- Handholding of target families is essential for optimal childcare practices, along with adequate hygiene and sanitation.

\n

- Counselling on family planning to ensure low birth weight babies aren't born is another measure.

\n

- Ensuring regular meals for children through properly streamlining anganwadis will also significantly reduce malnourishment.
