

Analysis of City Gas Distribution project

Why in news?

 $n\n$

The Prime Minister has laid the foundation for the ninth bidding for city gas distribution (CGD) projects recently.

 $n\n$

What are city gas distribution networks?

 $n\n$

\n

- India's natural gas consumption presently stands at 6.2% of its primary energy consumption and it has been targeted as 15% by 2020.
- Natural gas in India is either produced domestically or imported as LNG.
- It is produced in Assam, Bombay High, Krishna Godavari basin and the Cauvery basin.

\n

- Government of India has put thrust to promote the usage of natural gas as a fuel/feedstock across the country to move towards a gas based economy.
- Accordingly, development of CGD networks has been focused to increase the availability of cleaner cooking fuel (i.e. PNG) and transportation fuel (i.e. CNG) to the citizens of the country.
- The expansion of CGD network will also benefit industrial and commercial units by ensuring the uninterrupted supply of natural gas.
- Under the gas allocation policy, city gas enjoys the first priority in the allocation of cheap domestic gas to consumers, while the gas from fertiliser sector enjoys the second priority.

 $n\n$

What are the advantages?

\n

- With the expansion of city gas distribution(CGD) projects, it is expected that 200 lakh households will have piped gas connectivity very soon.
- Natural gas, predominantly methane, is a cheap and environment-friendly fuel with a very low emission of particulate matter.
- \bullet Natural Gas (as CNG) is cheaper by 60% as compared with petrol and 45 % with respect to diesel. \n
- Providing gas linkage to domestic households, the automobile sector, and small and major industries will play a major role in elevating the social status of the people.
- The additional savings from fuel bills can be invested into productive areas such as education of children, which will pave way for a faster socioeconomic development.

\n\n

What are the concerns with CGD networks?

 $n\$

۱'n

- Price control The CGD business model is currently based on the supply of cheap domestic gas which is both inherently flawed and unsustainable.
- The price of gas produced domestically is controlled through an <u>administered</u> <u>pricing mechanism</u> (APM) by the government and is about 65-70% lower than the imported LNG price.
- This establishes a huge spread between input prices (controlled by government) and output prices (market price), thereby enabling CGD entities to make large profits in a non-transparent manner.
- **Opportunity costs** Natural gas enjoys the opportunity cost of alternative fuels like petrol and diesel.
- Opportunity cost is the "cost" incurred by not enjoying the benefit associated with the alternative choice.
- Thus, CGD entities by bidding on natural gas gets a better return than

investing on other fuels, thus affording a hefty profit margin for them. \footnote{Nn}

- **Bidding** The availability of cheap gas has also led to irresponsible bidding, with bidders bidding zero or nominal tariffs in earlier rounds.
- This was done with the expectation that all costs will be recovered through huge profits that they will get as a result of low input and high output prices.
- However, as cheap domestic gas sources dry up, bidders will be faced with serious problems of cost recovery, thereby affecting viability and sustainability of the CGD system.
- This will pave the way for legal disputes, contract re-negotiations, higher non-performing assets and supply disruptions.
- \bullet These issues can be taken care of if the business model is based on sourcing natural gas at market prices by removing APM mechanism. \n
- \bullet This will provide a more solid foundation for the expansion of the CGD network in the country. \n

 $n\n$

What should be done?

 $n\n$

\n

- Energy consumption in India is growing at 4.2% per annum, which is the fastest among major economies of the world. $\$
- However, India's domestic production of natural gas is low and its import dependency stands at 45.6%.
- Thus, increasing production, developing the delivery infrastructure like terminals, stations and pipelines, along with giving priority for CGD allocation is necessary to ensure availability.
- A shift to a gas-based economy should ensure both availability and affordability and India has still a long way to go for transforming the economy to a gas-based one.
