

Augmenting Offshore Wind Power

Why in news?

 $n\n$

Ministry of New and Renewable Energy (MNRE) has recently declared revised targets for offshore wind power capacity addition.

 $n\n$

What is the recent move?

 $n\n$

\n

• The National Off-Shore Wind Policy was notified in 2015.

• The recently firmed up offshore wind power target is 5 GW by 2022 and 30 GW by 2030.

\n

MNRE had earlier invited Expressions of Interest (EoI).

- This was for the first 1 GW offshore wind power plant off the Gujarat coast.
- About 35 major players, global as well as local, in the offshore wind energy sector responded.

\n

- The National Institute of Wind Energy (NIWE) is designated the official agency to develop offshore wind power.
- **Challenge** There are difficulties in installing large wind power turbines in open seas.

۱'n

• As, offshore wind turbines are of much larger dimensions and capacities than onshore turbines.

\n

 $n\$

What are the relative advantages?

 $n\n$

\n

• Offshore wind power requires a higher initial cost.

\n

- \bullet However, it has several benefits over its onshore counterpart. \n
- \bullet Power output from these plants is steady, almost free from interruption. $\ensuremath{\backslash} n$
- In fact, it tends to increase a bit in the evenings to coincide with peak consumer demand.

\n

- \bullet Per unit power production is relatively high and the maintenance cost is low.
- India also has a strong wind power equipment manufacturing base, although it needs a revamp.

\n

- Importantly, offshore windmills do not need land.
- So, land acquisition, a major challenge for most terrestrial infrastructure projects is ruled out.
- Offshore wind power is, therefore, ideally suited for a land-short country like India.

\n

\n

 $n\n$

What are the prospects?

 $n\n$

\n

- **Potential** Preliminary studies have shown good wind potential in both southern tip of the Indian peninsula and the west coast.
- There is substantial scope off the coasts of Tamil Nadu, Gujarat and Maharashtra.

\n

- **Global** Globally, 17-18 GW of offshore wind power has been installed.
- UK, Germany, Denmark, Netherlands and China are the leading countries.
- \bullet There has also been a fall in offshore wind tariff in the recent years in some of these markets.
- **Investment** Government has assured a level-playing field to all investors, domestic and international.

\n

• There is thus a favourable power tariffs and policy environment for private investment.

\n

 $n\n$

\n

• **Cost** - There is constant inflow of new cost-cutting and output-enhancing technologies.

\n

• This would improve the sector's competitiveness as against the conventional power sector.

\n

• This is expected to sustain the economic viability of these ventures.

 $n\n$

What is the way forward?

 $n\n$

\n

• The energy generation potential of India's oceanic winds has largely remained untapped.

\n

• India, a late starter, needs to move faster to narrow the gap and meet its non-conventional energy goals.

\n

• Measures are essential to ensure that tariffs do not fall below the remunerative threshold.

۱'n

- Otherwise, the investors would lose interest in offshore wind power.
- Also, more intensive sea wind zones may be discovered in future.
