

Balancing The Environment And Economy

What is the issue?

\n\n

\n

- Low GDP growth is getting to be a serious cause of concern for the economy.

\n

- There are apprehensions that this would have a negative impact on the growth of employment, income and livelihood opportunities.

\n

- However, offering an environment perspective brings out a possible beneficial side to economic slowdown.

\n

\n\n

How are economic growth and environment related?

\n\n

\n

- Rapid **industrialisation** and urbanisation are inevitable to bring in desired levels of economic development.

\n

- This is also believed to be essential to substantially increase the **per capita income**.

\n

- However, these income-generating activities are sure to have **negative environmental consequences** such as pollution.

\n

- Noticeably, environmental quality is being compromised for the goals of mass employment generation and poverty reduction.

\n

- It is believed that with gradual increase in income levels along with growth in financial and technological capabilities, environmental quality could be restored.

\n

- But the reality is that the continued growth generating activities only increasingly deteriorates the environmental quality.

\n

\n\n

What is the economic significance of the environment?

\n\n

\n

- The economic significance of the environment is evident with the range of **ecosystem services** that it offers. These include:

\n

\n\n

\n

- i. provisioning services (food, irrigation, drinking water).
- ii. regulating services (climate regulation, water quality regulation).
- iii. cultural services (recreational and religious services).
- iv. supporting services (nutrient recycling, soil formation).

\n\n

\n

- Millions of households and economic activities utilise these ecosystem services for production and consumption.
- However, despite this high economic value, ecosystem services are **not traded in the markets**.
- Their **true values are thus not reflected in the economic system**.

\n

\n\n

What is the case with India?

\n\n

\n

- The above picture explains the shortfall of unrecognised economic significance of the environment.
- In India, the current method of **GDP calculation treats environmental damage costs as income**(as it is compensated with the income in other sectors such as the industry).
- This is misleading because it accounts only the environmental damage.

\n

- \n
- The inherent economic potential that is lost due to the environmental damage is unaccounted.
- \n
- Evidently, various studies have estimated the huge environmental damage cost and welfare loss due to the higher level of economic growth maintained in recent years.
- \n
- Notably, these costs and losses are equivalent to around 5-7% of the GDP in various years.
- \n
- This picture is despite the underestimations due to non-availability of data.
- \n
- Because, quantifying the unsystematised ecosystem services for damage assessment is a difficult task.
- \n
- Thus the **economic welfare lost due to the loss of ecosystem services** will be much higher than the current estimations in India.
- \n

\n\n

What is desired?

\n\n

- \n
- The low GDP growth is for sure a negative thing in many respects.
- \n
- However, in view of sustainable development, "**low growth**" could also imply a more "**protected environment**".
- \n
- Consequently, the **economic and social benefits that a healthy environment offers** is considerably higher than that of a GDP growth at the cost of the environment.
- \n
- Thus ensuring a quality environment can actually push income growth on a more sustainable and meaningful basis.
- \n
- Given all these, the **challenge of uncertainty in determining environmentally desirable growth rate** cannot be denied.
- \n
- However, maintaining 5-6% growth rate with strict environmental regulation is supposed to be a balanced one.
- \n
- In this line, the government can consider market-based instruments such as

pollution tax and tradable pollution permits as **pollution control measures**.

\n

- **Environmental accounting and green GDP** for India could be other possible tools.
