

Bats in Plantations

Why in news?

 $n\n$

A recent study shows that tea plantations in the Western Ghats hosts less-diverse bat communities than those found in coffee estates and forests.

 $n\n$

What are the findings of the study?

 $n\n$

\n

• Forests in Western Ghats have changed drastically.

• The study examined bat diet, echolocation, body size and wing morphology in different habitats in Valparai, Western Ghats.

• In Valparai tea and coffee plantations have fragmented natural forests.

• It found that tea plantations fared badly.

• Only few insectivorous bats that could adapt to highly modified habitats thrived here.

\n

• Coffee plantations did better because of native tree presence which is required for coffee growth.

• Protected areas and forest fragments were the most 'functionally' rich, by being home to bats with diverse morphologies.

\n

What is the significance of bats?

 $n\n$

\n

• Bats perform important ecological functions.

\n

- They are important insect controllers, pollinators and seed-dispersers.
- \bullet Different bat species can perform these varied ecological functions due to the physical features they have evolved. $\mbox{\sc h}$
- e.g Bats with short, broad wings are better suited to plucking off large insects on the wing, in densely-vegetated patches like the forests of the Ghats.

\n

 $n\n$

What should be done?

 $n\n$

\n

- Tea plantations will never be as rich for wildlife as coffee plantations.
- But it can be more biodiversity-friendly if small changes in land use practices is implemented.

۱n

• Bats and other fauna could benefit if tea plantations have a buffer of native trees on both sides of every river.

\n

• Protecting existing forest fragments and extending them wherever possible could also help.
