

Blue-Cheeked Bee-eater

Why in News?

The first breeding site of the Blue-Cheeked Bee-eater in peninsular India has been discovered in the saltpans of Aandivilai near the Manakudy Mangroves in Kanniyakumari district.

- Scientific Name Merops persicus.
- It is a near *passerine bird* in the bee-eater family, Meropidae.
- It is a passage *migrant and winter visitor in India*.
- **Appearance** It is a richly colored, slender bird.
- It is predominantly green, its face has blue sides with a black eye stripe, and a yellow and brown throat, the beak is black.

- **Habitat** Found in open areas as well as forests from lowlands up into middle elevations.
- **Distribution** It breeds across Northern Africa and the Middle East, from eastern Turkey to Kazakhstan and India.
- Occasionally, this bird appears as a rare vagrant north of its usual range, particularly in Italy and Greece.
- **Behaviour** It may choose to nest solitarily or in small, loose colonies of up to ten individuals. It is also known to share colonies with European bee-eaters.
- **Breeding Regions** Nesting sites are often located in sandy banks, embankments, or low cliffs, and occasionally on the shores of the Caspian Sea.
- Its breeding was primarily recorded in regions such as Nile Delta, Pakistan, and Iran while its wintering grounds include parts of Africa.
- **Diet** Feed on insects preferably dragonflies.

- Threats Habitat destruction, from developmental activities, and anthropogenic pressures.
- Conservation status
 - **IUCN** Least Concern.
