

## **Bridging the Gender Gap**

### **What is the issue?**

\n\n

\n

- Governments in recent decades have been striving hard to bridge India's centuries old gender gap through multiple innovative schemes.

\n

- While there has been considerable progress, much remains to be done on the gender front, which calls for a prudent analysis of policy.

\n

\n\n

### **What is the status of "Gender Parity" in India?**

\n\n

\n

- There are 63 million 'Missing Women' (not alive due to foeticide/infanticide) and 21 million 'Unwanted Girls' (explained below) in India.

\n

- Economic Survey 2017-18 acknowledges that "Missing Women" is one of the most pressing problems faced by our country.

\n

- Although the Survey finds improvement in a number of women empowerment indicators, it also shows how the skewed sex ratio has led to gender inequality.

\n

- Not surprisingly, India ranks a poor 87<sup>th</sup> in the "Global Gender Parity Report", which is published by "World Economic Forum" (WEF).

\n

- On "Women's Day", PM Modi had proclaimed female foeticide shameful and announced the expansion of "Beti Bachao, Beti Padhao" scheme.

\n

- In this context, it is important to reflect on the experience of the past 30 years of women centric policies and the progress made.

\n

\n\n

## Are education campaigns paying off?

\n\n

\n

- The government has lately taken to information campaigns to usher in a behavioural change among the masses to bridge the gender divide.

\n

- **Male Preference** - Statistics seem to imply that educational campaigns alone do little to reduce the deeply entrenched social idea of male Meta preference.

\n

\n\n

\n

- In fact, it is the more aware masses that are likely to engage in illegal sex selective abortions, to the extent that they are able to afford it.

\n

- Further, “Health Index” released by the NITI Aayog shows that in recent years, the girl-to-boy sex ratio at birth has dropped in 17 out of 21 large States.

\n

- Significantly, only in Bihar, Punjab and Uttar Pradesh has the sex ratio improved, implying the issue needs stronger initiatives than mere awareness.

\n

- **Job Awareness** - Rigorous research has not been conducted to measure the impact of information campaigns on improving the sex ratio.

\n

- But some randomised evaluation conducted by researchers affiliated to J-PAL has indicated some positive results regarding information campaigns.

\n

- The study confirmed that spread of job related information improved female employment and reduced discrimination against girls.

\n

- Additionally, such campaigns were also found to have encouraged parents to invest in their daughter’s education and significantly delay their marriage.

\n

- **Health Awareness** - Another J-PAL study found that HIV related awareness campaigns proved highly helpful in improving health metrics.

\n

- These studies suggest the merit in including risk information regarding behavioural actions in campaigns that target improvements in sex ratio.

\n

\n\n

## **What has been the impact of “Cash Transfer Schemes”?**

\n\n

\n

- Another common approach that governments take to encourage behaviour change and improve gender parity is “direct cash transfers schemes”.

\n

- Multiple State governments have implemented conditional and unconditional cash transfer schemes to motivate families to educate girls.

\n

- The impact of cash transfer schemes on “sex ratio” isn’t clearly understood, but such initiatives have definitely helped in bettering girl child education.

\n

- The spill over effects of such schemes is felt in aspects like women’s health, reduction in gender discrimination, and delay in marriages and child bearing.

\n

- While many of these aspects are behavioural changes, reduction in fertility rates (fewer children), and male preference are also likely in the long run.

\n

- Nonetheless, more rigorous evaluation is needed to establish and verify if the prediction are getting reflected on the ground.

\n

\n\n

## **What are the emerging trends in family planning?**

\n\n

\n

- The multiple pro-girl initiatives and financial support, government seems to have managed to ensure that women aren’t perceived as a burden.

\n

- But despite these, male preference however continues, as having a son was still valued far higher than that of a daughter.

\n

- Interestingly, it has been predicted that, if family size reduction is promoted alongside, then pro-girl initiatives will have little impact in bettering sex ratio.

\n

- Few rigorous studies have been conducted to assess long-term impacts of government programmes that aim to address skewed sex ratio.

\n

- More evidence should be generated in order to evolve policies that can sustainably improve the sex ratio and bring back India’s missing women.

\n

\n\n

## Quick Facts:

\n\n

## Missing Women:

\n\n

\n

- This is a measure of women/girls who don't exist currently, but would've lived had it not been for the male preference in our society.

\n

- These women/girls were either aborted during pregnancy or were killed as infants (infanticide), or died due to improper care after birth.

\n

- Their number presently accounts to about 63 million in India and this was estimated by projections from the expected natural sex ratio at birth.

\n

\n\n

## Unwanted Girls:

\n\n

\n

- Girls who were given birth by parents 'who were actually expecting a boy instead' are classified as unwanted girls.

\n

- These girls are identified by studying the deviance in the gender of the last child born (which is predominantly a boy in India).

\n

- This is because parents tend to prefer having a particular number of sons, the birth of whom marks the end of their need to reproduce.

\n

- They keep attempting for babies until the desired number of males are attained, thereby any girl born in this quest for a boy is classified unwanted.

\n

- The problem is that unwanted girls invariably face the risk of poorer care and larger family size, which curtails their overall life opportunities.
