

Challenges in Global Automotive Industry

What is the issue?

\n\n

\n

- The global automotive industry is on the verge of a big disruption.
- India's import dependence on batteries poses a challenge for adopting electric vehicles.

\n

\n\n

What is the status of global automotive industry?

\n\n

\n

- Digitisation, increasing automation, and new and emerging technologies would revolutionise the way people move.
- Urban passenger mobility has undergone significant changes over the past few decades due to rapid industrialisation and the boom of the IT sector.
- Travel patterns have become increasingly complex and difficult to predict and manage.
- These trends will shift markets and revenue pools, change mobility behaviour and build new avenues for competition and cooperation.
- This has put increasing pressure on bigger cities and their transport and infrastructure.

\n

\n\n

What are the expected changes due to the disruptions?

\n\n

\n

- With growing concerns towards sustainable development and mitigating

climate change, there is a need to shift from the current unsustainable approach to a more sustainable effort.

\n

- This would bring a shift in consumer behaviour and their buying pattern, although it would be interesting to watch how this trend changes geographically and across continents.

\n

- Globally, revenue pools from conventional sources such as one-time vehicle sales and aftermarket sales could continue to grow at their current pace.

\n

\n\n

What are the concerns before India?

\n\n

\n

- The Indian automotive industry has begun to feel the ripple effects of global disruption.

\n

- In India four technology-driven trends such as electrification, shared mobility, connectivity and autonomous driving are leading the automotive industry to this disruption.

\n

\n\n

\n

- The automotive market in India is going through a rapid metamorphosis, offering many choices to consumers beyond just internal combustion engine (petrol/diesel).

\n

\n\n

What measures needs to be considered in this regard?

\n\n

\n

- Across the globe electrification of vehicles is seen as a sustainable solution to counter the growing levels of vehicle pollution in metros is of particular importance to India today.

\n

- By 2030, electrification could lead to electrified vehicles holding a substantial share (up to 50 per cent of new vehicle sales in a breakthrough scenario) of the global automobile sector.

\n

- If India sees a similar momentum, it will significantly impact manufacturers across the automotive value chain. .
\n
- India needs to address the challenges of increasing fuel import costs and pollution using hybrid vehicles.
\n
- India needs to invest in infrastrucres related to EV motors and battery, charging technology, power electronics and EV software for the successful implementation of E-mobility.
\n
- Thus concerted efforts by key stakeholders can help EVs and hybrids become a self-sustaining and profitable market in the near future.
