

Challenges with Interest Rate Structure

What is the issue?

 $n\n$

Despite the lower inflation rates, interest rates have not reduced significantly in India, warranting a re-look at its structure.

 $n\n$

What does the inflation data reveal?

 $n\n$

\n

- The multi-month low CPI and wholesale inflation in December pose an interesting challenge for policymakers and the central bank.
- Inflation in Consumer Price Index (CPI), at 2.19% in December, is at an 18-month low, while the WPI, at 3.8%, is at an eight-month low.

 $n\$

\n

 The RBI has maintained a CPI projection of 4.4-4.8% for the second half of fiscal 2019.

\n

- Even in the October policy announcement, the bank projected 3.8-4.5% retail inflation in the second half with upside risk.
- It has even changed its policy stance to "calibrated tightening" from "neutral".

۱'n

- Neutral stance indicates a marginal increase in repo rate which is proportionately lesser to the inflation projections, while calibrated tightening indicates that there will not be a rate cut in the near future.
- However, the CPI number is way below projections made by RBI during its last few monetary policy pronouncements.
- Thus, the MPC and the RBI may well want to reassess the robustness of their

inflation projection mechanism in light of the data coming in.

• Also, factory output growth was a low 0.5% in November with manufacturing showing a contraction.

\n

• Given the weak economic data, RBI may look at a rate cut in its next monetary policy committee meeting.

 $n\n$

What are the challenges?

 $n\n$

\n

- The inflation data have also been challenging for policymakers, wherein different components show divergent trends.
- While headline CPI inflation is trending lower at 2.2%, core inflation (non-food, non-fuel inflation) is still remains at 6%.
- \bullet Also, there is a divergence between core rural and urban inflation, wherein the former stays at 6.34% while the latter stays at 5.26% in December. \n
- This rise in core rural inflation is attributed to the high rural health and education index numbers.

\n

- Thus, <u>divergences and volatility</u> in different <u>sub-groups</u>of inflation data serve as a major challenge in inflation assessment and projection.
- This gives rise to a broader question that whether the interest rate structure is lagging behind the big structural change in inflation in the last few years.

 $n\n$

Is there a need for change in the interest rate structure?

 $n\n$

\n

- Nominal interest rate refers to the interest rate before taking inflation into account, while a <u>real interest rate</u> is the interest rate that the lender or investor receives <u>after inflation is factored in</u>.
- For example, if a bond provides a 6% nominal yield and the inflation rate is 4%, then the lenders can benefit from the real rate of interest of only 2%.

\n

- Thus, Nominal interest rate Inflation = Real interest rate.
- Nominal interest rates will exceed real rates when the inflation rate is a positive number (as it usually is).
- \bullet But real rates can also exceed nominal rates during deflation periods. $\ensuremath{^{\text{h}}}$
- In India, headline CPI inflation has already $\underline{moderated}$ from around 10% in 2012-13 to 3.6% in 2017-18 and 3.7% in April-December this fiscal. \n
- Yet the nominal interest rate structure is maintained at a higher level and has not changed significantly.
- Thus, since the nominal interest rate is exceeding the inflation rate, <u>high real</u> interest rates are prevailing now.
- Thus, prominent policymakershave called for the RBI to take a re-look at the interest rate structure.
