

# **Chemical Weapons and Nerve Agents**

#### What is the issue?

\n\n

\n

- Nerve gas is allegedly used in ongoing Syria attack.  $\slash n$
- It is imperative at this juncture to look into the status of chemical weapons, particularly nerve agents or nerve gases.  $\gasharrow n$

\n\n

#### What are chemical weapons?

\n\n

∖n

- It is a toxic chemical in a delivery system such as bomb or artillery.  $\slashn$
- Anything specifically designed for use in direct connection with the release of a chemical agent to cause death or harm is a chemical weapon.  $\n$
- Each component of a chemical weapon is a chemical weapon, whether assembled or not, stored together or separately.  $\n$
- E.g. choking agents chlorine, phosgene, diphosgene and chloropicrin. Fluid builds up in lungs, choking victim.  $\n$
- Blister agents sulphur mustard, nitrogen mustard, phosgene oxime, Lewisite. Burns skin, mucous membranes and eyes; causes large blisters on exposed skin; blisters windpipe and lungs. \n
- Blood agents Cyanide destroys ability of blood tissues to utilise oxygen, causing them to 'starve' and strangling the heart.  $\n$
- Examples include hydrogen cyanide, cyanogen chloride, Arsine, VX.  $\^{\n}$

\n\n

What is CWC?

\n\n

∖n

• The Chemical Weapons Convention (CWC) is a consortium of 192 countries as signatories.

\n

- It seeks to limit the availability of chemicals that can be used as tools of mass destruction.
- In In 
  However, it allows member states to retain rights to use some of these chemicals for peaceful purposes such as riot control.
  In 
  In
  - Teargas shells, for example, are frequently used for riot control.  $\n$

\n\n

#### How is chemical weapons possession status?

\n\n

\n

- Of the 192 CWC signatories, Albania, India, Iraq, Libya, Russia, Syria, and the US declared possession of chemical weapons.  $\n$
- Of these, Albania, India, Libya, Russia and Syria declared completion of destruction of chemical weapons.
   \n
- Notably, by January 2016 the destruction of all chemical weapons declared by Syria has been completed.  $\sc{n}$
- Despite these, there have been continuous instances of chemical weapons attacks in Syria.

\n

\n\n

#### What are nerve gases?

\n\n

\n

Nerve gases are among the most lethal form of chemical weapons.

\n

• They notably have no use other than in chemical warfare.

\n

- The CWC lists chemicals under various degrees of manufacturing restriction.  $\space{\space{1.5}\$
- Under this, the nerve gases are among the most restricted.

\n\n

#### How do nerve gases work?

\n\n

∖n

- Nerve gas weakens the mechanism within the body responsible for the conduction of nerve impulses.
  - \n
- Acetylcholineesterase is a compound that catalyses the breakdown of the neurotransmitter acetylcholine.
  - \n
- Nerve gas prevents acetylcholinesterase from performing its normal function of breaking down acetylcholine.
- It leads to the muscles going into a state of uncontrolled contraction, a sign of paralysis or a seizure-like state.
- Death usually happens because paralysis extends to the cardiac and respiratory muscles.  $\gamman$
- Other symptoms could include dilation of pupils, sweating and gastrointestinal pain etc.  $\n$
- Nerve agents can also be absorbed through the skin.  $\n$

\n\n

## What is Novichok?

\n\n

\n

- As restrictions on weapons are based on chemical formulae, newer molecules can bypass restrictions.
  - ∖n
- Countries thus started to develop newer weapons to bypass the restrictions.  $\space{\space{1.5}\$
- This naturally led to the emergence of nerve agents and that is how Novichok evolved.
- Novichok is said to be 5-8 times more lethal than VX nerve agent.  $\n$
- Also, its effects are rapid, usually within 30 seconds to 2 minutes.
