

Commercial Coal Mining Reforms

Why in news?

\n\n

Cabinet Committee on Economic Affairs approved a methodology to auction coal blocks for commercial mining.

\n\n

What is the reason behind this move?

\n\n

\n

- The productivity of Indian coal sector has improved over the years.

\n

- But it remains below global standards.

\n

- This can be addressed if the assets auctioned are large, accessible, and ready for development.

\n

- The Government's move to commercial coal mining is a recognition that developing coal blocks on end-use basis is inefficient.

\n

- There are challenges in design and handover.

\n

- But, mainly, the end-user industries lack expertise, scale and incentive to do anything more than source their own needs.

\n

- This changes entirely with commercial mining where real productivity gains can be achieved and passed on to consumers.

\n

\n\n

What is the significance of this reform?

\n\n

\n

- It is the most ambitious coal sector reform since the nationalisation of the sector.

- \n
- It offers ample room for a competitive coal supply.

\n

\n\n

- \n
- The move from “an era of monopoly to competition” holds many strategic implications for an entire set of industries and companies.
- \n
- Already, large global and local mining majors have expressed interest in this landmark deregulation,
- \n
- It will allow mining and sale of coal without curbs on quantity, end-use or pricing.

\n

\n\n

What are the expected outcomes?

\n\n

- \n
- The expectation is that the mining majors will set new benchmarks in terms of mechanisation, automation, mining practices, etc, and drive up productivity.
- \n
- Distressed assets, in particular, will use this option to draw up a plan for turnaround after the debt recast.
- \n
- The opportunity will get larger as new commercial miners take full advantage of deregulation.

\n

- They can offer

\n

\n\n

- \n
- i. short-term contracts for seasonal needs (to serve utility demand or via the merchant market)
- \n
- ii. adopt more flexible pricing
- \n
- iii. supply higher quality blends to substitute imports

\n

\n\n

\n

- It is also expected that the current coal producers too will respond with innovation and customer orientation.

\n

\n\n

\n

- The immediate beneficiaries are power generators.

\n

- As, they can improve utilisation and margins by sourcing commercial coal selectively.

\n

- It makes it possible for new vertically integrated companies to own coal mining, to power generation, to distribution and retail supply.

\n

\n\n

What are the concerns?

\n\n

\n

- The downstream power utilities will gain from this, but are simultaneously faced with a major competitive threat.

\n

- As the output from commercial coal mines comes on line, it will have a sustained, moderating influence on energy prices.

\n

- The manufacturing sector is already diversifying its power procurement by buying from third-party sources and on the power exchange.

\n

- They will now have access to lower cost electricity with limited price volatility.

\n

- Similarly, as commercial miners target large energy users with captive power plants, discoms will lose the advantage of cross-subsidy.

\n

\n\n

What are the measures to be taken?

\n\n

\n

- Electricity regulators have to implement tariff reforms.

\n

- Cross-subsidy should also be rationalised to levels at which discoms can still hold on to large energy users.
\n
- This may not impact the smaller and lifeline consumers, as the State governments will channel the premium earned from auction of commercial coal to extend direct subsidy.
\n
- The success of this new policy will depend on incorporating lessons from the previous auctions, and deregulating it fully to allow efficiency and competition in the primary energy sector.
\n
- If this is ensured, there is good reason to expect the commercial coal auctions to become a success on sector reforms.
