

# **Defining the Point of Death**

#### What is the issue?

 $n\n$ 

\n

- Some hold that the cessation of a heart beats marks death but others argue hold that the brain's dis-functionality constitutes death.
- There is hence no clearly accepted point where a person can be declared dead, thereby mandating a legal definition for what constitutes death.

 $n\$ 

#### What has triggered the current debate?

 $n\n$ 

\n

- $\bullet$  A while ago, Kerala government issued protocols to confirm brain death cases with the intention of making organ transplantation more transparent. \n
- This has brought to the fore, the lack of clarity, medically and ethically, about assessing when the moment of death has occurred.
- $\bullet$  India needs clear standard operating procedures as well as a legal definition of death in order to ensure ethical conformity questions of life and death. \n

 $n\n$ 

## How did death become a grey concept?

 $n\n$ 

\n

- Historically, life was strongly linked to heart pumping blood and death was consequently identified by cardio-respiratory failure.
- Doctors would feel for a pulse, check for breath, and sometimes even hold a mirror before the nose to test for condensation.

- But the arrival of the modern ventilator upended the metrics of life and as intensive care medicine took shape, defining death became more complex.
- Advances in medi-care also furthered neurosciences and terms like "death of the nervous system" and "irreversible coma" are no longer valid.
- $\bullet$  Hence, defining life and death has now gone beyond the mere factual bodily indicators and has encompassed the domain ethics and philosophy. \n

 $n\n$ 

### What is the current legal status of death in India?

 $n\n$ 

۱n

• Presently, in India, two Acts give different answers.

 $n\n$ 

\n

- Brainstem death This (different from brain death) is acknowledged in the Transplantation of Human Organs Act, 1994.
- $\bullet$  According to this, a deceased person is one "in whom permanent disappearance of all evidence of life occurs". \n
- It encompasses in its ambit both "brain stem death" and "cardio-pulmonary" cessation, at any time after live birth has taken place.
- **Record Keeping Act** "Registration of Birth and Death Act, 1969" excludes the diagnosis of brain death and covers only cardio-respiratory aspects of life.

\n

Notably, while a patient on ventilator support is not deemed dead as per this
act although he might be brain dead.
\n

 $n\n$ 

## How is the ambiguity on life and death playing out elsewhere?

 $n\n$ 

\n

• In the U.S., the case of Jahi McMath who was declared brain dead at 13 has fuelled the debate on what constitutes death.

\n

- Notably, she is now 17 and survives on life support, and even attained puberty in the 4 years after she was declared brain dead.
- **Experts** Many opine that although legal definitions typically indent to define a bright border between life and death, biology of life is a lot more fluid.

\n

• Further, diagnosis of brain death functions is a self-fulfilling prophecy as once the ventilators are dis-connected, cardio-respiratory death follows invariably.

\n

 $\bullet$  While biology and law function differently, clear standard operating procedures and a legal definition would nonetheless help in functionality. \n
