

Digitization Drive

What is the issue?

\n\n

\n

- In the market place, the mode of settlement of daily transactions is returning to the pre-demonetization preferred pattern of cash settlement.

\n

- In next few months, with implementation of GST, expected from July 2017, drive towards digitalization would be strengthened.

\n

- However, some challenges are becoming apparent, which need to be understood and addressed for seamless transition to digital India.

\n

\n\n

What are the issues?

\n\n

\n

- The problems for digitalization are similar to those for expanding financial inclusion, i.e., **the last mile access**.

\n

- The **problems are mostly supply side issues**. The costs incurred by the banks have received much attention while the problems of the merchants have received scant attention.

\n

- Merchants in urban areas indicate that the major obstacle to the growth of digital payments is the **increasing costs for merchants**.

\n

- Merchants in urban areas complained that the recurring **monthly cost of maintaining the technology infrastructure** is growing rapidly and the increase in business volumes is not sufficient to support it.

\n

- A major component of the recurring costs is telephone bills which have more than trebled.

\n

- A cause for these rising phone bills is because merchants are often charged

an STD rate to the city where the banks' servers are located.

\n

- In the case of rural areas, the actual card usage has been low due to **the lack of digital payments infrastructure**, fears related to cyber security and lack of knowledge about electronic payments.

\n

- PoS machine availability in the villages continues to be low, let alone most business establishments in the villages possessing them.

\n

- The government departments and agencies in many small towns and rural areas are **not equipped to handle card payments** or receive NEFT, RTGS or IMPS transactions.

\n

- The **penetration of smart phones is also limited.**

\n

\n\n

What could be done?

\n\n

\n

- To begin with, on a pilot basis, the government can identify a few cities which have the potential for complete digitalization.

\n

- Initially the experiment can be conducted in a phased manner in different but small and homogeneous areas within the city.

\n

- Illustratively, a pilot experiment can be initiated in a campus of an educational institution and once fully digitalized can then be expanded to areas outside but around the campus.

\n

- Having gained the experience on how digitalization would work, the government could then extend digitalization to other parts in the select city, and later expand to other cities.
