

## **e-waste menace in India**

### **What is the issue?**

\n\n

The hazardous e-waste generated is getting accumulated in the country at an alarming pace, causing grave concern for public health and environment.

\n\n

### **How is the e-disposal infrastructure in India?**

\n\n

- \n
- 2 million tonnes of e- waste is generated annually.
- \n
- Just a fraction of it is being disposed off safely.
- \n
- Most of the discarded computers, phones and batteries and age-expired electrical gadgets are sold to junk dealers.
- \n
- They are ultimately recycled in the unorganised sector in a crude and clumsy manner.
- \n
- This causes more harm than the unprocessed items.
- \n
- A sizeable part of the e-waste is mixed with garbage and finds its way to landfill sites.
- \n
- Mumbai tops the list of e-waste generating cities, followed by Delhi, Bangalore and Chennai.
- \n
- India, as a whole, is 3<sup>rd</sup> in Asia and 5<sup>th</sup> in the world as an e-waste producer - the others being the US, China, Japan and Germany.
- \n

\n\n

### **What are the harmful effects?**

\n\n

\n

- They contain several hazardous substances, such as mercury, arsenic and other heavy metals.

\n

- They emit harmful radiation, degrades the soil, and releases toxins to pollute air and ground water.

\n

- About 40% of lead and 70% of other heavy metals found in landfills are traceable to e-waste.

\n

- Prolonged exposure to these pollutants can damage the nervous system, kidneys, and brain, and can cause respiratory disorders, lung cancer, skin ailments and other health problems.

\n

- 2/3<sup>rd</sup> of the workers in the unorganised e-waste recycling sector suffer from breathing difficulties, coughing, irritation, and other maladies.

\n

\n\n

## **What is the legal framework?**

\n\n

\n

- The country's e-waste disposal policy is actually robust.

\n

- The e-waste management rules, laid down by the environment ministry, even revolve round the judicious concept of "extended producer responsibility" (EPR).

\n

- Manufacturers are mandated to take back 30% of the discarded electronic equipment for appropriate disposal in the first two years of the enforcement of these rules.

\n

- This level is to be raised to 70% in the next five years.

\n

- However, none of this happening due to the lax regulatory infrastructure in the country.

\n

\n\n

## **What should be done?**

\n\n

\n

- India has a vibrant, informal waste-gathering sector with millions of waste pickers going door-to-door to collect garbage.

\n

- Industry can use this infrastructure gainfully to retrieve its discarded e-gadgets.

\n

- Besides, the government, especially the local pollution control boards, needs to consider training the unskilled e-waste recyclers to do their job in a safe and scientific manner.

\n

- A well-planned integration of the informal and organised waste-processing sectors can help in reducing the menace of e-waste to a perceptible extent.
