

Education - The Primary Component of Wealth

What is the issue?

\n\n

\n

- A World Bank study titled “The Changing Wealth of Nations 2018” has asserted that national wealth calculations need a comprehensive review.

\n

- It stresses that educational attainments is the most significant component, as opposed to mere financial wealth.

\n

\n\n

What does the study say?

\n\n

\n

- Investment in education is well recognised as the major or primary investment for most families in the world - one that also ensures sustained returns.

\n

- Acquisition of education is indeed acquisition of wealth, but despite education’s criticality, it isn’t prominently discussed in wealth discussions.

\n

- While there has been considerable research on the prevalent monetary inequality, even data on educational attainment across nations is scarce.

\n

- **The Study** - The World Bank’s recent study based their estimates on household survey data from 143 countries, over the past 2 decades.

\n

- Additionally, the study has estimated the share of education in the total wealth at about 64% - which makes it the primary determiner of richness.

\n

- Significantly, this will almost completely contradict the conventional notion of wealth as a “value of financial plus non-financial assets minus their liabilities”.

\n

- This might hence make the notion of “Rice - getting - richer” and “poor -

getting - Poorer" less sellable.

\n

- **New Dimension** - Education as an important wealth has been known for centuries, and there has been extensive documentation on the same.

\n

- But WB's study suggests that education is the "greatest wealth of all" by assigning it a massive 64% share in the total net - which is unprecedented.

\n

- Hence, the study is indeed path-breaking and further debates and discussions are needed to refine the context better.
