

# **Effects of Drugs Discharged into the Yamuna**

### Why in news?

\n\n

A recent study reveals the effects of the discharge of drug-containing effluents into the Yamuna.

\n\n

#### What is the study on?

\n\n

∖n

- Human body does not use the entire quantity of the drug when it is taken.  $\ensuremath{\sc n}$
- Resultantly, most of it is excreted and thus end up in aquatic systems via domestic sewage.
  \n
- The study thus looks at the occurrence, fate and ecological risks of these compounds.

\n

• It observed nine different pharmaceutical active compounds in the Yamuna river.

\n

• These are six over-the-counter drugs (aspirin, paracetamol, ibuprofen, ranitidine, caffeine, diclofenac) and three prescription drugs (carbamazepine, codeine, diazepam).

\n\n

### What were the findings?

\n\n

∖n

- The highest concentration of pharmaceutical compounds was located downstream Wazirabad at the point where Najafgarh drain joins the Yamuna.  $\n$
- This is one of the largest drains of Delhi and has an average discharge of about 25 cubic metres per second.

∖n

- This drain is the largest polluter of the river contributing more than 50% of the total discharge into the Yamuna.  $\n$ 

\n\n

∖n

- At this site, ibuprofen and paracetamol were found at a high concentration of 1.49 and 1.08 microgram per litre respectively.
- Previous studies have shown that even small concentration of ibuprofen could cause an antagonistic effect on aquatic organisms.  $\n$
- Studies have also shown that ibuprofen exposure could increase cyanobacterial growth in the water.  $\n$
- Caffeine was found in high concentration in most of the sites.  $\ensuremath{\sc vn}$
- Caffeine is used as a stimulant in medicine. Residue from beverages and other food products may also be a contributor.  $\n$

\n\n

## What could the impact be?

\n\n

\n

- The individual levels of the drugs were small and cannot cause acute toxicity to the marine life.
  - \n
- But the mixture of compounds can "possibly cause chronic toxicity" to aquatic life and to humans who use this water for drinking purposes.  $\n$
- This not only affects the biodiversity of the river but can also lead to the rise of superbugs.
  - \n
- The discharge of drug-containing effluents in rivers and other water bodies can potentially make many microbes drug-resistant.  $\n$
- The sewage treatment plants are not designed to take care of these pharmaceutical compounds.
  \n
- The study thus highlights the need for the government to bring in the guidelines or specific rules to arrest and address this.  $\n$
