

## External Sector Turbulence

### What is the issue?

\n\n

\n

- India's external sector is becoming more vulnerable and less resilient due to various issues.

\n

- Government need to take long term measures to address the rising concerns.

\n

\n\n

### What are the external sector related concerns faced by India?

\n\n

\n

- Current account deficit of India stands at \$15.8 billion or 2.4 per cent of GDP.

\n

- In the case of portfolio investments the net inflows stood at \$5.3 billion but substantial net capital outflow is around \$8.1 billion.

\n

- This resulted in a depletion of \$11.3 billion of the foreign exchange reserves (on a BoP basis) as against an accretion of \$11.4 billion in Q1 of 2017-18.

\n

- In aggregate, the outflows from the outstanding forex reserves over end-March 2018 till date September 2018 were \$25.26 billion.

\n

\n\n

\n

- Income elasticity of demand for India's export has remained stagnant and, therefore, the share of India's export remained constant at 1.7 per cent in the world export.

\n

\n\n

### What are the reasons behind such concerns?

\n\n

\n

- The slide in the value of the rupee has led to rise in the current account deficit and a substantial net capital outflow.

\n

- Persistent rise in crude price and the pressure of rising protectionism in world trade is severely affecting India's trade.

\n

- Protracted stagnation in competitiveness is another important factor is the movement in the Real Effective Exchange Rate (REER).

\n

- Apart from this the firming up of the US growth rate and appreciation of the US dollar against major currencies has also brought a host of trouble to India.

\n

- All such interlinked and collective factors have resulted in India's external sector becoming more vulnerable and less resilient.

\n

\n\n

### **What measures were taken in this regard?**

\n\n

\n

- Government had taken non-monetary measures like restrictions on non-essential imports like finished electronics, certain textiles, automobiles, high-end consumer products.

\n

- Government has also removed 5 per cent withholding tax on masala bonds, removal of the foreign portfolio investor exposure limits in corporate bonds and a freer ECB regime.

\n

- The measures taken together are expected to garner \$8-10 billion.

\n

- There are also plans to adjust the Real Effective Exchange Rate by the RBI.

\n

\n\n

### **What are the issues with government's measure?**

\n\n

\n

- Essentially, the measures are of two types: restriction on imports; and

encouragement of debt inflows.

\n

- Import restrictions are fine as tools for crisis management but they go against the spirit of reform.
- Further, measures like the relaxation on “masala” bonds and ECBs amount to a quick fix just to postpone the problem.
- The burgeoning CAD could not be financed in a non-disruptive manner as the net capital inflows were not adequate.
- The rise in REER in India is lower than in many economies, however those economies are not seeing such a crash in their currency value as India because they do not suffer from a high CAD.
- At a conceptual level, increase in the REER index reflects diminishing competitiveness.
- Thus, the recent measures announced by the authorities may provide some short-term relief.

\n

\n\n

### **What measures need to be considered?**

\n\n

\n

- The sustainable solution to India’s problem is encouraging Greenfield FDI and non-oil exports such as iron and steel, non-ferrous metal, and automobiles.
- Efforts should also be made to further strengthen exports of marine products and chemicals, It is important in this regard to enhance quality-control measures.
- The trend of the direction of exports is required to be shifted towards the Middle East and North Africa, apart from the US, China and the EU.
- This is the long haul, and this requires clear policies and prioritisation at India’s end.
