

## Farm Support Prices

### Why in news?

At the recent NITI Aayog Governing Council meeting, much emphasis was laid on making the minimum support price (MSP) for crops more effective.

### What is the issue with pricing in agriculture?

*Agriculture accounts for 15-18% of our national GDP but provides livelihood for over 50% of the workforce.*

- **Risks-** Agriculture is subject to several risks including weather, production, quality, market, and price.
- **Seasonal nature-** Crop cultivation is seasonal and regional in nature.
- **Price collapse-** During the short marketing period, prices tend to collapse because of perceived surplus.
- **Global price reflection-** As our domestic markets are largely integrated with the global markets (through trade and investment routes) our crop prices often tend to reflect global trends.

### What is the logic of MSP?

- The main objective of MSP is to assure a minimum price to ensure that the farmer recovers his cost of production and gets a decent return on investment.
- It is a deemed or unwritten options contract.
- The government has an obligation to buy from farmers if crop price falls below MSP but farmer is free to sell in the open market.

### What are the issues?

- **Role in crop production-** A routine hike in MSP season after season does little to drive crop production and productivity.
- **Crop diversification-** Over the years, MSP has ceased to be an instrument to encourage crop diversification.
- **Procurement issues-** MSP is not backed by a robust procurement system and is doomed to fail, especially in the context of a production centric approach.
- The organisations engaged in crop procurement seem to be unequal to the job in terms of quantities procured and geographies covered.
- **Environmental impact-** Mono-cropping of rice and wheat and open-ended

procurement at support price are leading to disastrous environmental impacts.

- **Consumption**- There is little policy effort to boost consumption of key food crops, despite the fact that our per capita availability is relatively low.
- There is a skew in the pattern of consumption.
- **Newer issues**- It includes worsening land constraints, looming water stress, climate change, etc.

### What is the need of the hour?

- **Procurement system**- With MSP we need a robust procurement system that helps advance sustainability.
- **Trade and tariff policy**- Alongside, an appropriate trade (export/import) policy and tariff (customs duty) policy is necessary.
- The policies must seek to protect the interests of domestic growers, without compromising the interests of consumers.
- **Boosting consumption**- If our policies focus on boosting consumption as much as on production, the downward price pressure faced by growers will ease.
- We need to reimagine our farm policies and review the working of related institutions.
