

Floods - an opportunity for Assam

What is the issue?

\n\n

\n

- The Prime Minister has recently announced he would appoint a high-powered committee to find “a permanent solution” for Assam’s recurring flood problem.

\n

- Ecologists feel that a real understanding of the problem is essential before the committee is formed.

\n

\n\n

How was flood an opportunity for Assam?

\n\n

\n

- Floods have not been a “problem” as such for Assam a century back.

\n

- For centuries, the region relied on the **annual flooding and recession** of the Brahmaputra and its tributaries.

\n

- The **productivity of its agriculture and other non-farm activities** centred on the events of flood as it sustained the rural livelihoods.

\n

- Floods naturally made the **lands fertile** and people could earn a livelihood with little labour.

\n

- Even today, bamboo **fishing** nets and traps on water bodies and submerged agricultural lands during the monsoons emphasize the significant role of floods in Assam.

\n

- Also, **Kaziranga’s** annual rejuvenation by floods is essential for the landscape and its unique wildlife to survive.

\n

- The unique biodiversity of Kaziranga is rejuvenated by a dynamic system that connects the Brahmaputra with its alluvial floodplains.

\n

\n\n

How have floods become a problem now?

\n\n

\n

- The perception of floods as a “problem” in Assam is a 20th century phenomenon.

\n

- **Economy** - British colonials viewed the low-lying areas of the floodplains of the Brahmaputra as a potential source of revenue.

\n

- Also, the demand for new lands to meet the growing requirements of **Bengal’s jute industry** led to the migrated east Bengali peasants' settlement in lowlands of Assam.

\n

- Floods began to cause damage to the thriving jute cultivation as a result of which **flood control** started appearing on the policy agenda.

\n

- **Embankments** - The Assam **earthquake** of 1950 raised the bed of the Brahmaputra.

\n

- Resultantly, floods began to threaten the built environment of commercially important **cities**.

\n

- As a measure of flood control and protecting these urban settlements, **embankments** were built in huge numbers.

\n

- Consequently, the **confinement of the river flow** led to higher water levels and increased hydraulic pressure during the monsoon.

\n

- Bank erosion, **embankment failures and breaches** now have become major causes of flood devastation in Assam.

\n

\n\n

What are the impacts?

\n\n

\n

- Floods as against being an opportunity, now are adversely impacting the livelihoods of poorer communities.

\n

- As a result, there is an increase in social inequalities.
\n
- The diverse wildlife is being put to endangerment.
\n
- The unique biodiversity of the region is also losing its sheen.
\n

\n\n

What lies ahead?

\n\n

- \n
- Assam's case presents a picture of how a natural event turns into a disaster with human intervention.
\n
- Thus defining the problem in relation to its past is essential to respond appropriately.
\n
- Assam's rivers are an opportunity for its riverine ecosystem, its people and wildlife.
\n
- Government's remedial measures and policy-making should consider not just deciding but also knowing the uniqueness of the region and problem of flooding.
