

Gender Parity in Nobel Prizes

What is the issue?

\n\n

\n

- Only 6% of the total individuals who have won Nobel Prize up till 2016, are women.

\n

- This calls for assessing the level of gender parity in Nobel prize winning.

\n

\n\n

How has the trend been?

\n\n

\n

- There have been 881 Nobel Prize winners from the time that the first one was given out in 1901.

\n

- However, less than 50 of them have been women.

\n

- Moreover, in some fields of expertise, the dry spell has been carrying on for decades.

\n

- E.g. the last time a woman won a Nobel Prize for Physics was in 1964

\n

- Two of the six laureates who were awarded prizes in Physics and Chemistry this year - Donna Strickland and Frances Arnold - are women.

\n

- They are only the third and fifth women Nobel laureates in Physics and Chemistry, respectively, since Nobel prizes inception.

\n

\n\n

\n\n

Does a gender bias exist?

\n\n

\n

- Despite the awareness about gender equality in the 21st century, the Nobel Prizes still show the disparity.

\n

- The huge gender divide clearly indicates an institutional backlog in the consideration of Nobel-worthy discoveries.

\n

- It is also to be noted that black and minority ethnic men are also underrepresented.

\n

- The demographic of winners perpetuates a stereotype of old white men being the only achievers in science.

\n

- The Nobel Museum curators found no proof as such of the committee refusing to give an award because of the gender of the nominee.

\n

- Many women were nominated for their groundbreaking revelations a number of times, but have not won prize.

\n

- These call for the community of scientists to introspect over what makes an enabling environment for women to practise science in.
