

GM Regulations in India

What is the issue?

\n\n

\n

- Despite the ban on local production and import of foods having genetically modified (GM) content, GM food has widely penetrated the Indian markets.

\n

- But this has led to no real health or environmental consequences, which only supports the assertion that GM food is safe.

\n

\n\n

What are the shocking regulatory lapses?

\n\n

\n

- “Centre for Science and Environment” (CSE) study indicated that as much as 32% of the processed foods marketed in India carry GM ingredients.

\n

- As GM imports are banned, importers have to currently make a declaration that their goods are free of GM components at the customs.

\n

- Yet, nearly 80% of the marketed foods that tested GM-positive in the CSE study were imported in contravention of the ban.

\n

- More significantly, some of the GM products falsely claimed on their labels to be GM-free, which is a clearly spiteful violation to deceive consumers.

\n

- All this reflects poorly on the country’s GM regulatory systems.

\n

\n\n

What is the GM crop scenario in India?

\n\n

\n

- Currently, BT cotton is the only approved GM crop for commercial cultivation

in India and it accounts for 90% of the cotton acreage now.

\n

- While no GM food crop has been permitted thus far, GM foods have already deeply penetrated into the Indian markets.

\n

- Notably, Cottonseeds (of BT-cotton), which bear GM DNA, are routinely fed to cattle whose milk is part of regular human diet.

\n

- In recent years, even cottonseed oil has begun to be used as a cooking medium individually or admixed with other edible oils.

\n

- This oil, if not properly refined, can retain remnants of GM DNA.

\n

\n\n

What the differing opinions on GM?

\n\n

\n

- The fundamental issue really is the impact that the genetically tweaked foods can have on health and environment.

\n

- If the vociferous anti-GM lobby argues that “GM Food” can pose wide-ranging hazards but most scientists disagree on this.

\n

- In fact, there has been no detectable incidence of health or environmental hazard due to GM crops in the past 2 decades (since GM trials began).

\n

- Also, several scientific studies conducted in the countries where GM crops are extensively farmed and consumed have not found any adverse effect.

\n

\n\n

What is the way ahead?

\n\n

\n

- Poor regulations in India have resulted in careless sowing of BT-Cotton and the extensive penetration of GM foods into the markets.

\n

- Despite these serious lapses, hardly any harmful fallout has been observed until now, which is hence a vindication of safety of GM crops.

\n

\n\n

\n

- The government should, therefore, take note of these facts and lift the ill-advised embargo on the approval of new GM seeds.

\n

- The cutting-edge technology of genetic manipulation needs to be put to gainful use for the benefit of farmers, consumers and biotech-based industries.
