

## **Growing Threat of Cyber Warfare**

### **What is the issue?**

\n\n

\n

- Cyber-space has emerged as a potential arena for international confrontations.

\n

- Countries like China are already working on expanding their cyber capabilities and India too much start enhancing its cyber-defence capabilities.

\n

\n\n

### **How serious is cyber threat?**

\n\n

\n

- The U.S. Defence Science Board, in a recent report had cautioned that the U.S. cyber defence capabilities were not up to the mark.

\n

- It additionally noted that the next decade is bound to witness massive additional deployment of cyber offence capabilities by many nations.

\n

- As these observations are coming from one of the most potent countries in cyber space currently, the enormity of the challenge is only implicit.

\n

- Significantly, India is consciously and speedily making a serious foray into digital space.

\n

- India's vulnerabilities are only bound to grow exponentially.

\n

- A 2017 study found that India ranked 4<sup>th</sup> in online security breaches.

\n

- India also accounted for over 5% of global threat detections.

\n

\n\n

## What are the various cyber threats?

\n\n

\n

- Cyber threats can manifest in many ways.

\n

- The most visible are cyber crimes, cyber theft, cyber espionage, cyber intrusions etc.

\n

- These are relatively low-end threats.

\n

- Criminal hackers can certainly cause data breaches and even financial loss.

\n

- Countering such large scale threats is important.

\n

- The real danger lies in targeted cyber attacks coming from adversarial nation states that carry out strategically planned and sophisticated cyber attacks.

\n

- “Stuxnet Attack”, which damaged the Iranian nuclear centrifuge facility, is thought to be a coordinated operation of the governments of U.S. and Israel.

\n

- Cyber tools are slowly becoming a regular part of the arsenal of nations.

\n

- Hence, it is essential to be aware of future cyber-wars and take precautionary measures.

\n

\n\n

## What is required?

\n\n

\n

- The three main components of any national strategy to counter cyber threats are defence, deterrence and exploitation.

\n

- **Defence** - For the defence of critical cyber infrastructure, National Critical Information Infrastructure Protection Centre (NCIIPC) was established.

\n

- While this is a positive, it now needs to partner individual ministries and private companies.

\n

- It should put procedures in place to honestly report breaches.

\n

- However, there are limits to defensive strategies in the cyber domain as the field is highly conducive for offensive capabilities.  
\n
- Therefore, cyber deterrence and exploitation have become important, although they are complex and not completely understood now.  
\n

\n\n

## What are the challenges?

\n\n

- \n
- Nuclear deterrence works because there is clarity on the destructive potential.  
\n
- But this is not the case with cyber warfare.  
\n
- Notably, cyber capabilities of an adversary is not all that apparent.  
\n
- This is because unlike nuclear arsenal, there are no missiles to be counted.  
\n
- Besides these, identifying the time of the start of the attack and tracking the origins of the attack are also complex tasks.  
\n
- For these reasons, deterrence in cyber domain cannot operate in isolation.  
\n
- It thus needs the support of economic and diplomatic domains as well.  
\n

\n\n

## What are the structures that need to be created?

\n\n

- \n
- **Militaristic View** - The most serious cyber attacks are when an external state threatens the national security of India by exploiting the cyberspace.  
\n
- The danger cannot be countered by an intelligence agency like the *NTRO* or a research organisation like the *DRDO*.  
\n
- The lead agency to deal with this will have to be the defence services.  
\n
- This has to gather intelligence, evaluate targets and prepare cyber attack plans.

- \n
- Also, cyber operations cannot be a standalone activity.
- \n
- It has to be integrated with land, sea and air operations, as a part of information warfare.
- \n
- **Defence Cyber Agency** - India is one of the few countries which still do not have a dedicated cyber Command in its military.
- \n
- While the setting up of a Defence Cyber Agency has been announced, the effort looks lacklustre and half hearted.
- \n
- It is important for a dedicated cyber agency to have significant autonomy.
- \n
- It should have an expanded mandate on its own to erect a strong cyber arsenal.
- \n

\n\n

## **Quick Facts**

\n\n

## **National Technical Research Organisation (NTRO)**

\n\n

- \n
- NTRO was set up in 2004.
- \n
- It is a technical intelligence agency under the National Security Advisor (NSA).
- \n
- It falls directly under the Prime Minister's Office.
- \n
- It also includes National Institute of Cryptology Research and Development

(NICRD) within its ambit.

\n

- It works for developing technological capabilities in various fields.

\n

- It acts as a super-feeder agency for providing technical intelligence to other intelligence agencies on internal and external security.
