

GSAT-7A Launch - GSLV-F11

Why in news?

\n\n

ISRO launched the communication satellite, GSAT-7A with GSLV-F11 (Geosynchronous Satellite Launch Vehicles).

\n\n

What is GSAT-7A?

\n\n

\n

- GSLV-F11 injected GSAT-7A into a Geosynchronous Transfer Orbit (GTO) very close to the intended orbit.

\n

- GSAT-7A is an advanced communication satellite with a Gregorian Antenna and other new technologies.

\n

- GSAT-7A is the 39th Indian communication satellite of ISRO to provide services to users in Ku-band over the Indian region.

\n

- The satellite operating in the Ku band will service communication needs for network-centric operations of the Indian Air Force and the military.

\n

- Most of the functional requirements of the communication payloads and other systems have been derived from ISRO's earlier geostationary INSAT/GSAT satellites.

\n

\n\n

A Satellite To Aid Air Power

\n\n

What is the key feature?

\n\n

\n

- At 2,250 kg, GSAT-7A is the heaviest satellite launched by GSLV-Mk-II since it began using the indigenous cryogenic engine.

\n

- The cryogenic stage of this vehicle has been modified to increase the thrust

rate.

\n

- The rocket was pushing the limits of its capabilities in launching satellites of the two-tonne class for the seventh time.

\n

- This is a standout factor with this launch and 12 other successful flights carried out so far by ISRO's GSLV-Mk-II rocket.

\n

- They include six successive flights since 2014 with an indigenous cryogenic fuel upper stage.

\n

\n\n

What is ISRO's GSLV programme?

\n\n

\n

- GSLV-Mk-II is ISRO's fourth generation rocket with three stages.

\n

- The first stage has four liquid strap-ons and a solid rocket motor.

\n

- The second has a high thrust engine using liquid fuel, and the third is the cryogenic upper stage.

\n

- The indigenous cryogenic engine was tested successfully for the first time in 2014.

\n

- The cryogenic stage uses liquid hydrogen as fuel and liquid oxygen as an oxidiser.

\n

- Compared to solid and earth-storable liquid propellant stages, it is a highly efficient rocket stage that provides more thrust for every kg of propellant it burns.

\n

- ISRO initially used 7 cryogenic engines sold by Russia for the early phase of its GSLV programme that began in 2001.

\n

- GSLV launches with Russian engines have had mixed success, with only two flights performing well.

\n

- ISRO is developing a more powerful, fifth-generation GSLV-Mk-III rocket to launch satellites in the 4-6-tonne category.

\n

- GSLV-Mk-III had a successful development flight recently when it launched

the 3,423-kg [GSAT-29](#) communication satellite.

\n

- GSLV-Mk-III is the designated launch vehicle for India's upcoming second moon mission and the first human space flight scheduled for 2022.
