

Haldi and Litchi Controversy

Why in news?

\n\n

Two stories have renewed discussions on **scientific rigour and ethics**. The stories were around haldi (turmeric) and litchi.

\n\n

What is the the Haldi controversy?

\n\n

\n

- The substance that gives haldi its bright yellow hue is **curcumin**.

\n

- They have innumerable virtues like anti-inflammatory, anti-malarial, anti-cancer and, as a piggyback on nanofibres to regenerate bone tissues.

\n

- Recently, American scientists have debunked the medicinal value of curcumin in a reputed journal.

\n

- They concluded that there was no evidence regarding therapeutic benefits of curcumin and it is a waste of money on researching it to find a new drug.

\n

- Curcumin may not make for a classical drug going strictly by the tenets of medicinal chemistry, but it certainly qualifies as an '**adjunct drug**' to treat some infectious diseases.

\n

- So, summarily dismissing curcumin research as wasteful would be like burying a lot of remarkable science around Haldi.

\n

\n\n

What is the Litchi controversy?

\n\n

\n

- Turns out, **eating Litchi and then not eating an evening meal, could be fatal**. It kills a lot of children in Muzaffarpur region of Bihar, the litchi capital of India.
\n
- Recently, a revelation was made in Lancet. Litchi fruits are laden with **naturally occurring toxins** like hypoglycin A and methylenecyclopropylglycine.
\n
- These could **trigger low glucose levels** and metabolic derangement among children. The toxins embedded in the fruit reverses all its inherent sugariness.
\n
- The dispute began when a set of scientists alleged that the Lancet study **did not follow a basic ethical practice in science** i.e., acknowledging similar previous findings.
\n
- It is called as 'scientific misconduct'. Truly, the Lancet did swung into action to figure out what went wrong in this case.
