

Heavy Rains in Kerala

Why in news?

\n\n

\n

- Southwest monsoon has caused a series of floods and landslides in several districts of Kerala.

\n

- One of the five shutters of the Cheruthoni dam on Idukki reservoir was opened as waters rose close to the maximum storage level.

\n

\n\n

Why is Idukki significant?

\n\n

\n

- Idukki is one of the largest arch dams in Asia that was commissioned in 1975.

\n

- The Idukki lake sprawls across Kerala's lifeline Periyar river.

\n

- It was created by the arch dam of Idukki, and the smaller Cheruthoni and Kulamavu dams.

\n

- The Idukki arch dam has no shutters.

\n

- The Cheruthoni dam has been opened only twice (1981 and 1992), both during the northeast monsoon.

\n

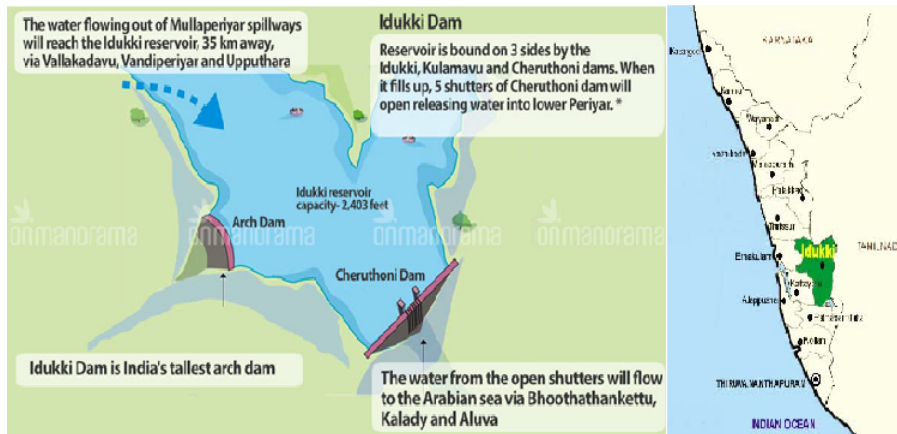

- The recent one is the third time and after a gap of 26 years.

\n

- Notably, this is the first time that the dam was opened due to rains from southwest monsoon.

\n

\n\n

\n\n

How is the southwest monsoon in Kerala?

\n\n

\n

- Kerala as a whole has received 15% excess rain and Idukki district got 41% excess until the first week of August.

\n

- Persistent rain since the onset of the monsoon has left Idukki and other reservoirs downstream overflowing.

\n

\n\n

\n

- The dam was opened to ease the pressure of water on the Idukki hydel reservoir.

\n

- Also, for the first time, shutters of 22 dams including Idamalayar were opened due to heavy rains.
