

IMD - Monsoon Forecast

Why in news?

\n\n

The Indian Meteorological Department has recently released the monsoon forecast for this year.

\n\n

What are the key findings?

\n\n

∖n

• The country would experience a normal monsoon for the third successive year.

\n

- South-west monsoon at 97% of the long period average (LPA) is expected. \n
- Long Period Average (LPA) is the average annual rainfall for the period 1951-2000.

\n

- The LPA comes to about 89 cm of rain. n
- Monsoon is considered normal if average rainfall is between 96% and 104% of the LPA.

\n

- Anything less than 90% of the LPA is considered a deficient monsoon. $\slash n$

\n\n

What does it imply?

\n\n

\n

- The forecast of a normal monsoon enhanced the economic outlook. $\ensuremath{\sc vn}$
- For farmers especially, this has given fresh expectations. $\ensuremath{\sc vn}$
- This is the third year in a row to look forward to a high output for a variety of

crops.

∖n

- However, it is not to be forgotten that fiscal realities have come in the way of realising higher farm incomes.
 - \n
- The Centre has been supportive of higher returns through the Minimum Support Price mechanism. \n
- Moreover, additional bonuses have been announced by States such as Madhya Pradesh for procurement.

\n

\n\n

What is the need for caution?

\n\n

∖n

- Government efforts have mainly helped only rice and wheat. $\ensuremath{\sc n}$
- This trend has led to a skew towards these crops. $\slash n$
- This is especially worrying from a water management perspective. $\ensuremath{\sc n}$
- As the above crops are heavily dependent on groundwater. $\ensuremath{\sc n}$
- With a normal monsoon, another year of good cropping is expected. $\slash n$
- But unremunerative prices will depress public sentiment. $\slash n$
- So it is vital for the Centre to arrive at a policy. $\slash n$
- Farmers should be given constructive advice on the ideal cropping mix. $\ensuremath{\sc n}$
- They should be helped to get the cost-plus-50% margin that the Centre has promised them. \n

\n\n

Why is water management crucial for India?

\n\n

\n

• Rainfall ranges from a few hundred millimetres or less in the northwest to more than a few thousand millimetres elsewhere.

\n

• The long-term challenge for India is to make the most of the rainfall it receives.

\n

- India notably uses more water to grow crops comparing to, say, China. \n
- Combined with distortions in procurement subsidies, water stress due to exorbitant use is inevitable. $\gamman{\cap{black}l} n$

\n\n

What should be done?

\n\n

∖n

• The Master Plan for Artificial Recharge to Ground Water drawn up by the Centre should be pursued scientifically.

\n

- This is to help States (with the most water-stressed blocks) get adequate funds to build artificial recharge structures. \n
- Moreover, for farmers choosing to continue with wheat and rice, transfer of expertise is crucial. \n
- Also, provision of equipment that enables efficient utilisation of water is vital. $\ensuremath{\sc vit}$ n
- A good monsoon raises agriculture's contribution to GDP growth. $\gamma{\label{eq:good} \label{eq:good} \label{eq:goodd} \label{eq$
- So it is essential that the governments invest consistently to harvest the monsoon. γn
