

Impact of Crude Oil Price Rise

Why in news?

\n\n

\n

- As a large importer of crude oil, India benefited significantly from lower prices - due to consequent lower inflation & budget deficits.

\n

- As oil prices touched a 2 year high this week, some of these gains could be reversed.

\n

\n\n

What has led to the price rise?

\n\n

\n

- Drawdown in inventories, especially in the US.

\n

- Continued geopolitical risk in West Asia (particularly Saudi Arabia).

\n

- Better compliance with the voluntary production cut agreed by the 'Organization of the Petroleum Exporting Countries' (OPEC)

\n

- As the OPEC is expected to work for \$70 a barrel, the price spike is expected to stay for a while.

\n

\n\n

What are the challenges for India?

\n\n

\n

- **The Fall years** - India witnessed significant positives when oil prices fell by over 50% between 2014 and 2015.

\n

- The windfall for the government was to the tune of 0.9% of the GDP in terms of lower subsidy outgo and higher tax collection.

- \n
- This benefited firms, households and also boosted public investments.
- \n
- **Currently** - As oil prices have increased, this could reverse the above and impede economic recovery in the near future.
- \n
- It could have implications for growth, inflation, currency, current account deficit and fiscal deficit.
- \n
- Every \$10 increase in oil price has been noted to increase CPI inflation by 0.6-0.7% points and also worsen the 'Current Account Balance' by 0.4% of the GDP.
- \n

\n\n

What are the actions taken?

\n\n

- \n
- Since the government raised excise duty when prices were falling, it could come under pressure to reverse the hike now.
- \n
- The Union government reduced excise duty by Rs 2 per litre on petrol and diesel last month.
- \n
- This was followed by a reduction in VAT rates by states such as Gujarat and Maharashtra.
- \n
- More such moves could strain government finances, lower revenues and would result in lower public investments.
- \n
- Notably, reduction in excise duty on petrol and diesel by Re1 per litre lowers collection to the tune of 0.08% of the GDP.
- \n

\n\n

What are the macro-economic implications?

\n\n

- \n
- The uncertainty in the economy due to oil prices and other factors like GST could worsen the overall outlook in the long run.
- \n
- If oil prices reach \$65 per barrel, inflation could go up by 30 basis points and

the real GVA could be 15 basis points lower for the current fiscal.

\n

- Inflation fears could potentially prevent rate cuts and weaken market sentiments.

\n

- While bond yields have gone up already, persistent higher oil prices will also affect corporate India's profit margins.

\n

- This could delay the much awaited earnings revival and would also affect the equity market where stocks are richly valued.

\n

\n\n

What is the way forward?

\n\n

\n

- The situation is not alarming for India at the moment, but policymakers would need to be watchful.

\n

- While RBI will take a call on interest rates in December, the government needs to avoid the temptation of reducing taxes.

\n

- It would need higher revenue to push capital expenditure for fostering economic growth that is currently sluggish.

\n

- It will be extremely important to keep fiscal deficit in control in order to protect hard-won macroeconomic stability.

\n

\n\n

Quick Fact

\n\n

OPEC (Organisation of Petroleum Exporting Countries)

\n\n

\n

- It is an intergovernmental organization which was founded in 1960 and is headquartered in Vienna.

\n

- Its currently has 14 members - "Algeria, Angola, Ecuador, Equatorial Guinea, Gabon, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, UAE and

Venezuela”.

\n

- OPEC countries account for an estimated 44% of global oil production and 73% of the world's proven oil reserves.

\n

- This gives OPEC a major influence on global oil prices and it acts as a cartel of sellers who wish attempt for maximum profits.
