

## **Importance of Agri start-ups in India**

### **What is the issue?**

\n\n

Agri start-ups that serve the small farmer need more seed funding, incubation and mentoring to make an impact.

\n\n

### **What is the need?**

\n\n

\n

- Modernising Indian agriculture will require change in key elements of the sector - supply chains and markets; production support; credit and crop insurance.

\n

- Indian entrepreneurs are developing new technologies and business models to meet this challenge.

\n

- In 2018, the country had nearly 500 agricultural start-ups.

\n

- In the past five years alone, these start-ups raised nearly \$130 million from investors in about 70 deals.

\n

- However, supply chains for perishable commodities such as fruits and vegetables still remain largely fragmented in India, with smallholder farmers earning low margins.

\n

- Unpredictable demand, price volatility and post-harvest losses compound the risks.

\n

- Hence, they need much more investment and support to fulfil their potential.

\n

\n\n

### **What are the successful business models so far?**

\n\n

\n

- **Supply chain efficiency** - A number of start-ups are using data and technology to improve supply chain efficiency.

\n

- WayCool, distributes fresh produce to sellers ranging from small shops to large retail outlets, reduces waste and inefficiency by using analytics, process management software and connected devices.

\n

- Jumbotail, connects retail grocery stores with food processors and farmer producer organizations.

\n

- Ergos, operates a chain of efficient and hygienic rural warehousing facilities that are located within easy access of small farms.

\n

- **Production support** - A number of start-ups have created alternative channels to deliver inputs to farmers at low cost.

\n

- AgroStar, created a standalone mobile app, a web service, and a customer call centre, through which farmers can obtain high-quality products for all of their farming needs.

\n

- Most small farmers cannot afford to buy farm equipment.

\n

- In such cases, some start-ups are offering on-demand rentals and enabling farmers who own equipment to rent it to others.

\n

- Gold Farm, connects farmers who need equipment with farmers who own equipment using a cloud-based platform.

\n

- **Finance** - Most small farmers lack access to collateral-free financing and crop insurance.

\n

- To overcome, some start-ups use satellite imagery and machine learning to facilitate crop insurance for smallholder farmers that come with reduced premiums and more timely and accurate payouts.

\n

\n\n

## **What should be done?**

\n\n

\n

- Agricultural start-ups in India have addressed systemic bottlenecks in the agricultural sector, instead of focussing on specific commodities.

\n

- As a result, they have the potential to scale up nationwide.

\n

- However, in addition to investment capital, Indian agricultural start-ups need technical advice and access to global markets and talent.

\n

- Several venture capital and private equity funds are stepping in and applying their experience from other sectors and countries.

\n

- Investments across the agricultural supply chain in India have averaged about \$250 million in each of the last five years.

\n

- But most of that capital has gone into front-end supply chain solutions, including branding, distribution and food delivery rather than farmer-focussed innovations.

\n

- Thus, start-ups that serve small farmers need more seed funding, early-stage capital, incubation and mentoring to unlock their immense growth potential.

\n

- If that is done, Indian start-ups can help define the future of Indian agriculture.
