

## India and GM-Mustard

### Why in news?

\n\n

\n

- The genetic engineering appraisal committee (GEAC), India's biotechnology regulator has approved the environmental release and cultivation by farmers of DMH-11.

\n

- It is a genetically modified (GM) hybrid mustard developed by scientists at Delhi University.

\n

\n\n

### What are genetically modified crops?

\n\n

\n

- Genetically modified crops are plants used in agriculture, **the DNA of which has been modified** using genetic engineering techniques.

\n

- The aim is to introduce a new trait to the plant which does not occur naturally in the species.

\n

- In food crops include resistance to certain pests, diseases, or environmental conditions, and **improving the nutrient profile of the crop**.

\n

- In non-food crops include production of pharmaceutical agents, biofuels, and other industrially useful goods, as well as for bioremediation.

\n

- More than 10% of world's crop lands has been planted with GM crops.

\n

\n\n

### What are the benefits of GM crops?

\n\n

\n

- Better Pest and Disease Resistance.  
\n
- Greater tolerance of stress, such as drought, low temperatures or salt in the soil.  
\n
- High yield and faster growth, they can be cultivated and harvested in areas with shorter growing seasons.  
\n
- More nutritious, and tastier.  
\n
- May be possible produce medicines or even vaccines.  
\n
- Can be made resistant to specific herbicides.  
\n

\n\n

### **What are the drawbacks with GM crops?**

\n\n

- \n
- Can cause Unpredictable side effects.  
\n
- Can cause ecological damage.  
\n
- Lead to over use of herbicides.  
\n
- Not accessible to every poor farmers.  
\n
- Problem with Intellectual property rights.  
\n

\n\n

### **What is the status of GM varieties in India?**

\n\n

- \n
- The country has yet to approve commercial cultivation of a GM food crop.  
\n
- **BT Cotton:** BT cotton was first used in India in 2002.  
\n
- **The only genetically modified cash crop under commercial cultivation in India is cotton.**  
\n
- Now it's being grown by Indian farmers on some 11 million hectares.

- \n
- Only 1/3<sup>rd</sup> of the kapaas or raw un-ginned cotton harvested by farmers.
- \n
- Remaining 2/3<sup>rd</sup> comprises the seed that is crushed to extract oil.
- \n
- Cotton-seed oil is, indeed, India's second largest indigenously produced oil today after mustard.
- \n
- The de-oiled cake or meal remaining after oil extraction is, likewise, fed to milch animals.
- \n
- During its introduction it was found to be promising for many farmers but after few years it created distress among the farmers.
- \n
- It **failed to fulfil its promises** such as high yield, pest resistance, drought resistance.
- \n
- The **seed prices are determined by corporates** which is highly expensive for the farmers.
- \n
- Many hectares of the land has been spoiled by this seeds.
- \n
- **BT Brinjal:** The GEAC in 2007, recommended the commercial release of Bt Brinjal.
- \n
- It was developed by Mahyco (Maharashtra Hybrid Seeds Company) in collaboration with the Dharward University of Agricultural sciences and the Tamil Nadu Agricultural University.
- \n
- BT brinjal was overturned in February 2010 by the then Environment Minister who assumed the role of regulator and ordered a suspension on the transgenic vegetable's cultivation.
- \n

\n\n

### **What are the benefits of GM Mustard?**

\n\n

- \n
- GEAC has recently given a green signal for taking a decision on commercialization.
- \n
- Indigenously developed seeds, the patent remains with government unlike with cotton it remains with corporates.

\n

- India Plans for food fortification to achieve SDG, this will help to achieving its goal.

\n

- Yields are expected to rise by up to 30 per cent.

\n

- India imports 15 million tonnes (Mt) of edible oils worth almost \$11 billion annually, Mustard oil production from this variety of crop will save a lot on Foreign exchange exchequer.

\n

\n\n

## **What is the way forward?**

\n\n

\n

- Environment ministry is the final conclusive authority in this regard.
- \n
- If the Minister's consent is obtained, GM mustard would be the first transgenic food crop to be allowed for commercial cultivation in Indian fields and would be a gateway for several genetically-modified food crops in India.
- \n
- Many of the GM crops in world today are cultivated for animal feed, the effects of GM crops on Humans are yet undiscovered.
- \n
- It is to be noted that many Developed countries closed their doors for GM foods.
- \n
- The legal and regulatory status of GM foods varies by country, with some nations banning or restricting them, and others permitting them with widely differing degrees of regulation.
- \n
- GM varieties should be promoted in a responsible way, and lot of awareness need to be created among the stake holders.
- \n
- Other than bio-safety concerns, transgenic technology is necessary for India to be scientifically relevant as well as have better seeds to address threats from climate change.
