

## **Indian Squid**

## Why in News?

The ICAR-Central Marine Fisheries Research Institute (CMFRI) recently said that it decoded the gene expression pattern of Indian squid having major implications from neuroscience to environmental science.

- Scientific Name Uroteuthis duvaucelii.
- It is also known as the Indian calamari.
- Group It is a cephalopod species, any member of the molluscan class Cephalopoda.
  - This group includes highly advanced species such as squids, octopuses, cuttlefish, and nautiluses.
- Family Loliginidae, typically called inshore or neritic squids.
- **Appearance** Indian squid has a distinctive coloration, with a light pinkish-gray body and 2 large fins on either side. They have 8 arms and 2 longer tentacles that they use to capture prey.

- **Behavior** Generally, squids are extensively known for their rapid growth rate, limited lifespan, and complex population structures
- They are fast swimmers and are capable of propelling themselves through the water using a jet propulsion system.
- This allows them to reach speeds of  $\underline{up \ to \ 40 \ km/h}$  when escaping from predators or chasing prey.
- Squids tend to prefer areas with high levels of dissolved oxygen, as this is crucial for their respiration.
- **Distribution** It is distributed in the Indo-Pacific region, occurring in depths between 30 and 170 meters.
- Along the coast of India, squids are commonly found in the waters off the coasts of Tamil Nadu, Kerala, and Goa.
- **Diet** This species is an *active carnivore* that feeds mainly on crustaceans and small fishes and often exhibits cannibalistic behavior.

## • Conservation Status

- IUCN Least Concern.
- Uses Food resource, utilized as fertilizer supplemental food source for highend and

expensive cultured animals.

• Other Species - Bigfin reef squid - IUCN Status - "Data Deficient".
