

India's fight against Leprosy

\n

- 16 years ago, Leprosy was eliminated globally as a public health issue. But, India's fight against leprosy is far from over.

\n

- The WHO asked South-East Asian countries, including India which accounted for 60% of such cases worldwide in 2015, to focus on preventing disabilities in children.

\n

\n\n

What are the facts?

\n\n

\n

- According to WHO, leprosy affected 2,12,000 people globally in 2015. **India alone reported 1,27,326 new cases, accounting for 60% of new cases globally.**

\n

- Of the new cases, 8.9% were children and 6.7% presented with visible deformities. The remaining 10,286 new cases (5%) were reported by 92 countries. Thirty countries reported zero new cases.

\n

\n\n

Why it is an unacceptable number?

\n\n

\n

- Though present numbers are a fraction of what was reported a decade ago, they are unacceptable, as an effective treatment for leprosy — multidrug therapy, or MDT — has been available since the 1980s and can fully cure leprosy.

\n

- Global statistics show that **94% of new cases were reported from 14 countries.** Only 6% of new cases were reported from the rest of the world.

\n

- India is among the 22 countries considered as having a “high burden for

leprosy” along with high transmission by WHO.

\n

\n\n

How it spreads?

\n\n

\n

- While the **mode of transmission of leprosy is not known**, the most widely held belief is that the disease was transmitted by contact between those with leprosy and healthy persons.
- More recently, the possibility of transmission by the respiratory route is gaining ground. There are also other possibilities such as transmission through insects which cannot be completely ruled out.
- In most parts of the world **males are affected more frequently than females**, often in the ratio of 2:1, according to WHO’s Global Leprosy Report.

\n

\n\n

What needs to be done?

\n\n

\n

- World Leprosy Day is observed on the last Sunday of January since 1954. To effectively combat stigma, **a multi-sectoral approach is needed**.
- Health authorities need to reach out to and include leprosy-affected persons and communities in their programming.
- Laws or regulations that sanction or abet discrimination against persons suffering from leprosy should be repealed.
- A concert of voices should be mobilised to counter harmful social attitudes. NGOs and civil society organisations should be included in campaigns to challenge leprosy-related stigma, and to address discrimination against affected persons and their family members.
- In 2016, **WHO launched the Global Leprosy Strategy 2016-2020: Accelerating towards a leprosy-free world**, with the aim of reinvigorating efforts to control leprosy and avert disabilities, especially among children

still affected by the disease in endemic countries.

\n

\n\n

Conclusion:

\n\n

India, which is among the endemic countries, has been advised to include **strategic interventions in national plans to meet the new targets**, such as screening all close contacts of persons affected by leprosy; promoting a shorter and uniform treatment regimen, and incorporating specific interventions against stigmatisation and discrimination.
