

India's improvement in Public Health

Children represent the future of our nation. The highest possible physical and mental development can only be attained by investing in the initial five years of a person's life as this ensures survival with improved cognition.

\n\n

The Ministry of Health & Family Welfare (MoHFW) is therefore working towards ensuring the most productive life for a person by specifically focussing on the initial five years of life.

\n\n

Does India have improved in public health?

\n\n

\n

- India should take pride in its progress in public health. Life expectancy has increased from 63.5 to 67.9 during the last decade; through 2009 to 2015, the maternal mortality rate has decreased from 212 deaths per 100,000 live births to 167 deaths and infant mortality rate has decreased from 50 to 37 deaths per 1,000 live births.

\n

- We have also **eradicated polio and eliminated maternal and neonatal tetanus.**

\n

- These successes mark India's dedication to ensuring its people remain healthy and productive.

\n

- However, as our country moves towards achieving its aspirations of better health, one of the biggest challenges we continue to face is high child death and disability.

\n

\n\n

How India handles Child Mortality?

\n\n

\n

- Every year, 2.6 crore children are born in India; nearly 11.4 lakh die before their fifth birthday, many from preventable causes. We are determined to save the life of every child.
- A powerful weapon against deadly childhood diseases is immunisation.
- To ensure that every child has access to immunisation, MoHFW launched **Mission Indradhanush (MI)** in 2014.

\n\n

Does MI works well?

\n\n

- MI is a special drive to vaccinate all unvaccinated and partially vaccinated children, protecting them against 10 life-threatening diseases, including **diphtheria, whooping cough, tetanus, polio and measles**, among others.
- During MI drives, pregnant women are administered the tetanus vaccine, **ORS packets and zinc tablets** are distributed for use in the event of severe diarrhoea or dehydration and vitamin A doses are administered to boost child immunity.
- MI is one of the largest immunisation programmes in the world. Since the launch of MI, full immunisation coverage has increased by 5 per cent to 7 per cent.
- The goal of MI is to achieve more than 90 per cent full immunisation coverage among children in the country by 2020.

\n\n

Universal Immunisation Programme:

\n\n

- Further, the government has strategically introduced several new vaccines in the Universal Immunisation Programme (UIP): The pentavalent vaccine, which protects against five diseases, was introduced throughout the country in 2015; **rotavirus vaccine**, which protects against rotavirus diarrhoea, has been introduced in four states so far; and **inactivated polio vaccine**, which protects against polio, was introduced in 2015 and expanded across all states

by the middle of 2016.

\n

- In the coming weeks, the govt. will introduce two new vaccines into the UIP — measles-rubella (MR) vaccine, for protection against measles as well as congenital birth defects caused by rubella, and pneumococcal conjugate vaccine (PCV) to protect against pneumonia.

\n

- Pneumonia and severe diarrhoea are responsible for more deaths of children under five in the country than all other infectious diseases.

\n

- **Pneumococcal pneumonia is responsible for an estimated annual 5.6 lakh cases and 1.05 lakh deaths in India.**

\n

- Measles and rubella also contribute significantly to India's child mortality and morbidity. Thankfully, the MR vaccine protects children against measles as well as rubella.

\n

- Protection from rubella is essential to prevent congenital rubella syndrome, which can cause blinding cataracts, deafness and heart disease.

\n

\n\n

What are the impacts of India's Health initiatives?

\n\n

\n

- Immunisation helps the country invest in human capital, contributing to future economic growth and reducing the economic burdens of hospitalisation and treatment costs. And it offers wider benefits.

\n

- For instance, the lessons learned from the special immunisation campaign have contributed to strengthening other public health services, including deworming and diarrhoea control.

\n

- Trainings offered to frontline workers are facilitating a higher number of institutional deliveries and increase in newborn care, in addition to immunisation.

\n

- As health workers reach out to people in previously unaccessed and remote areas, MI has created an interface to connect populations with a wide range of health services and strengthened health systems in these areas.
