

India's Manned Mission to Space

Why in news?

\n\n

Indian Space Research Organisation (ISRO) has announced the definitive timeline for Gaganyaan mission.

\n\n

What is ISRO's plan?

\n\n

\n

- ISRO has announced its first manned mission which is set to be a reality by 2022.

\n

- By this, an Indian astronaut will go on a space odyssey by 2022 on board 'Gaganyaan'.

\n

- ISRO has roped in Indian Air Force pilots to identify the first set of astronauts for a human space flight.

\n

\n\n

What are the works in progress?

\n\n

\n

- **Launch vehicle** - The launch vehicle for this mission is planned to carry heavy payloads into space.

\n

- The spacecraft carrying human beings, called crew module, is likely to weigh in excess of 5 to 6 tonnes.

\n

- For this purpose, GSLV Mk-III (or) Launch Vehicle Mark-3 (LVM-3) is being developed.

\n

- This comes with cryogenic engine, with capabilities to deliver much heavier payloads much deeper into space.

\n

\n\n

\n

- **Re-entry & Recovery tech** - ISRO has already tested the GSLV Mk-III with experimental crew module.
\n
- It came back to Earth after being taken to an altitude of 126 km into space.
\n
- This this known as Crew module Atmospheric Re-entry Experiment (CARE).
\n
- **Crew Escape System (CES)** - ISRO had tested the Crew Escape System, a mechanism for an advance warning.
\n
- System warns the crew module of anything going wrong with the rocket and pulls it away to a safe distance.
\n
- After this, it can be landed either on sea or on land with the help of attached parachutes.
\n
- **Life support** - The Environmental Control & Life Support System (ECLSS) is meant for humans inside to live comfortably.
\n
- It ensures that conditions inside the crew module are suitable for living.
\n
- The ECLSS -
\n

\n\n

\n

- i. maintains a steady cabin pressure and air composition
\n
- ii. removes carbon dioxide and other harmful gases
\n
- iii. controls temperature and humidity
\n
- iv. manages parameters like fire detection and suppression, emergency support
\n
- v. takes care of food and water management
\n

\n\n

\n

- **Astronaut training** - ISRO still plans to set up a permanent facility like a

foreign facility, to train candidates for the first manned mission.

\n

- Candidates would be trained for at least two years in living in zero gravity.
- It would also include dealing with a variety of unexpected experiences of living in space.

\n

\n\n

What are the challenges?

\n\n

\n

- A manned space mission is very different from all other missions that ISRO has so far completed.
- In terms of complexity and ambition, even the missions to the Moon (Chandrayaan) and Mars (Mangalyaan) are nowhere in comparison.
- For a manned mission, the key distinguishing capabilities that ISRO has had to develop include

\n

\n\n

\n

- i. the ability to bring the spacecraft back to Earth after flight
- ii. building a spacecraft in which astronauts can live in Earth-like conditions in space

\n

\n\n

\n

- Over the years, ISRO has successfully tested many of the technologies that are required.
- However, many other challenging ones are still to be developed and tested.
