

## **Internet First - After Net Neutrality**

#### Why in news?

 $n\n$ 

\n

- After intense debate, the Telecom Regulatory Authority of India (TRAI) has vouched clearly for Net Neutrality (NN).
- But there is also some merit in the arguments against net neutrality, which calls for further debate.

\n

 $n\n$ 

#### What does the verdict imply?

 $n\n$ 

۱n

- According to TRAI, internet services should by non discriminatory with no interference in the treatment of content.
- $\bullet$  This includes practices like blocking, degrading, slowing down or granting preferential speeds or treatment to any content.  $\$
- This means no blocking & throttling of lawful services and no paid prioritisation, except for predefined specialised services like IPTV.
- The logic is that you should not pay any more for choosing a service or website other than the normal internet access charge.
- As the DoT is currently immersed in formulating a new telecom policy, TRAI's recommendations could serve as input.
- Notably, acknowledging the vagueness in defining NN, TRAI has recommended a principles-based approach on a case by case basis.

 $n\n$ 

## How can internet be kept neutral?

\n

• While adopting a principled approach can indeed be a challenge for which TRAI had one interesting recommendation.

\n

- It proposed the creation of a not-for-profit, multi-stakeholder body for monitoring & enforcement of regulations in the internet space.
- The body is envisioned to comprise members representing different categories of service providers.
- This includes large and small content providers, representatives from research and academia, civil society and consumers.

 $n\n$ 

### What is the existing internet ecosystem in India?

 $n\n$ 

\n

- Smartphone users have reached 300 million, Internet users are up by 70 million and mobile traffic grew 75% in 2016.
- Hence, the touted data revolution will be largely driven by mobile networks, which will provide the base for digital India.
- Start-up space in India is also promising as some 4,750 tech start-ups operate here which is next only to United States and Britain.
- $\bullet$  Proponents of NN argue that this has been possible because the net in India is already in a state of de facto neutrality. \n
- Notably, an earlier order of TRAI banned differential pricing for content, which has kept the net essentially neutral thus far.
- $\bullet$  The current recommendations are hence essentially a re-iteration of the status quo in the sector.  $\mbox{\ensuremath{\backslash}} n$

# What are the arguments against net neutrality?

 $n\n$ 

\n

• The strongest argument in favour of NN is that it promotes innovation that a censored internet is likely to hinder.

۱n

• This standard narrative in favour of NN assumes two things - \n

\n \n

\n

 ${\rm i.} \ \, {\bf Access} \ \, {\bf to} \ \, {\bf internet} \ \, {\bf exists} \ \, {\bf to} \ \, {\bf enable} \ \, {\bf participation}$ 

 ${\it ii.}$  Open internet boosts innovation activity

\n

\n \n

\n

۱n

• But about 30% of India's population currently does not have access to the internet and is still largely a privileged good.

۱n

• As affordability is the main challenge, packages such as Facebook's 'Free Basics' will enable internet access for many users.

\n

 $\bullet$  While this will indeed be limited access which is against NN, the subscriber always has the option to migrate to the uncensored net. \n

\n\n

## Why is the overall picture hazy?

 $n\n$ 

\n

• It is clear that projects like Free Basis will considerably bridge the digital gap for the masses.

۱'n

• But whether such endeavours will bring grave harm upon the very foundations of open internet isn't clear.

۱'n

• The fear is that permitting such proposals might lead to other damaging "Content provider – internet provider" arrangements.

۱n

• This needs further pondering as it can potentially inhibit competition and weaken innovation.
