

## ISRO's Path to 100th Satellite Launch

### Why in news?

 $n\n$ 

With the recent launch of ISRO's 100th satellite, it is imperative to know the strengths and track its progress over the years.

 $n\n$ 

\n

## Institution building is a key to great power making

\n

 $n\n$ 

#### What is the recent launch?

 $n\n$ 

\n

• ISRO recently launched its 100th satellite Cartosat-2, a weather observation satellite.

\n

• The PSLV carried along with this, 30 other satellites from its spaceport of Sriharikota in Andhra Pradesh.

\n

 They include two satellites from India and 28 satellites from six countries -Canada, Finland, France, Korea, the UK and the US.

 $n\n$ 

#### How has ISRO evolved?

 $n\n$ 

۱n

- The Indian National Committee on Space Research was constituted by the Indian government in 1962, with Vikram Sarabhai as its chairman.
- This was mandated to look into the possibility of having a national space

programme.

\n

• ISRO started with the launch of Nike-Apache Sounding rockets from Thumba way back in 1963.

۱n

- The "leapfrogging" for India came with the famous SITE (Satellite Instructional Television Experiment) launch in 1975.
- $\bullet$  This was an experimental satellite communication project to provide educational television programmes on agriculture and farming. \n
- Jointly developed by ISRO and NASA's cooperation, it helped both farmers and Indian space scientists to gain technical expertise.
- $\bullet$  Thereafter ISRO has made strides with many of its successes and is now a major player in the field of outer space. \n

 $n\$ 

## What are its strengths?

 $n\n$ 

\n

- **Personnel** ISRO has always believed in the "homegrown" talent and has provided them enough chances and platform.
- Most of its engineers and scientists come from departments of basic sciences from India's universities.
- **Objective** When Soviets launched the Sputnik-1 in the late 1950s, a cold war of space rivalry began between them and the Americans.
- $\bullet$  Being a newly independent nation and facing resource scarcity, India never saw outer space as a battleground for supremacy. \n
- $\bullet$  The primary idea with ISRO was to use space technology for developmental purposes.  $\ensuremath{^{\text{h}}}$
- The Indian space programme, since its inception, has primarily been a "civilian" space programme.
- **Institution** ISRO, as an institution, started functioning only from August 15, 1969.

\n

- As an institution, it has been a standing proof for the age-old proverb "institution building is a key to great power making".
- $\bullet$  It started delivering successfully almost every time and even after some failures, ISRO has come out stronger every time.  $\mbox{\sc h}$

 $n\$ 

## What were the challenges?

 $n\n$ 

\n

- The National Committee on Space Research was constituted in 1962, the same year when India lost a costly war to China.
  - \n
- The then condition of India's finance was not conducive for any space goals and determinations.

\n

- Thus, engineers and scientists in Indian space programme were always under a burden of lot of expectations to prove the purpose.
- $\bullet$  There were critics arguing against spending on "elite" things like outer space when millions were toiling hard under poverty. \n

 $n\n$ 

\n

- $\bullet$  However, the resolve of ISRO and political will of the ruling dispensation in the 1960s made India take forward its space dreams. \n
- $\bullet$  ISRO still works within very low budgets, as compared to the huge budgets of NASA and other space programmes.  $\mbox{\sc h}$

 $n\n$ 

### **Quick Fact**

 $n\$ 

#### **Thumba**

 $n\$ 

\n

- Thumba is a suburb of Thiruvananthapuram, the capital of Kerala.
- The Thumba Equatorial Rocket Launching Station (TERLS) is an Indian spaceport operated by the ISRO.
- $\bullet$  Thumba is located very close to the *magnetic equator* of the Earth, making it the ideal location to conduct atmospheric research. \n
- ullet It is ideal for low-altitude, upper atmosphere and ionosphere studies.
- It is currently used by ISRO for launching sounding rockets/research rocket (an instrument-carrying rocket to take measurements and perform scientific experiments during its sub-orbital flight).

 $n\n$ 

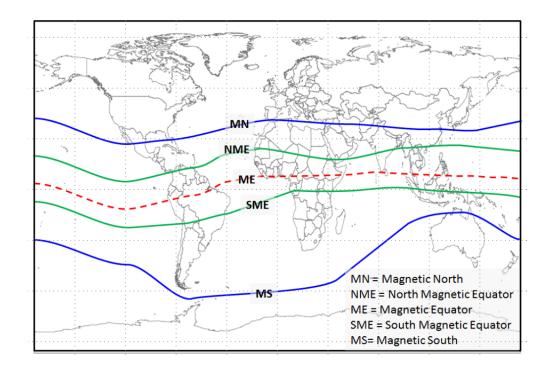

# **Magnetic Equator**

 $n\n$ 

\n

- The magnetic equator is defined as the line around the earth where the magnetic field is horizontal, or parallel to the earth's surface.
- $\bullet$  It does not circle the earth as a smooth line like the geographic equator, but instead it meanders north and south.  $\mbox{\sc h}$
