

Japan - Past and Future of Abenomics

What is the issue?

\n\n

\n

- Japan's economy is witnessing a healthy condition which was absent nearly for the last two decades.

\n

- The success is mainly attributed to the economic agenda called Abenomics.

\n

\n\n

What is Abenomics?

\n\n

\n

- It refers to the multi-pronged economic program of the Japanese prime minister Shinzo Abe.

\n

- It seeks to remedy the two decades of economic stagnation faced by Japan.

\n

- The plan focussed primarily on money supply, government spending and industrial competitiveness.

\n

- It went on for printing additional currency to make Japanese exports more attractive and generate modest inflation.

\n

- Additionally, government embarked on spending programs to stimulate demand.

\n

- There was also a range of regulations to make Japanese industries more competitive, including making it easier for companies to fire ineffective workers.

\n

- The plan also aimed to restructure the utility and pharmaceutical industries and modernize the agricultural sector.

\n

\n\n

What were the results?

\n\n

\n

- **Unemployment** has significantly been addressed and the overall labour force participation was raised.

\n

- Everyone in Japan who wanted a job now has a job.

\n

- Notably, a majority of this is achieved by bringing **women** into the Japanese **workforce** in huge numbers.

\n

- Also, growth is driven not just by big company profits but increasingly by **small and midsize businesses**.

\n

- Considerably, this growth is not due to the external demand; as the Chinese growth slows and Europe and the U.S. remain sluggish.

\n

- It is evidently, a result of the various domestic reforms and measures under Abenomics.

\n

\n\n

What challenges lie ahead?

\n\n

\n

- The **rapid aging** presents a huge challenge in terms of productivity.

\n

- Also, **population decline** discourages companies from investing in the country.

\n

- There is still a difference between good full-time jobs and dead-end part-time jobs.

\n

- This makes the demand for making growth more inclusive, as **wage growth** has been **inconsistent**.

\n

- Above all **poverty** still remains a problem.

\n

\n\n

What should be done?

\n\n

\n

- Japan needs to take measures to continue improving the productivity of Japanese businesses.

\n

- To keep productivity rising, there is a need to reform the labour market.

\n

- One important change is to do away with long, unproductive work hours and encourage companies to reward efficiency and results instead.

\n

- Companies must be incentivized to put systems in place for the regular hiring of midcareer employees.
