

Kaziranga and Brahmaputra Floods

What is the issue?

\n\n

While on one side Kerala is devastated by floods, here is why floods are crucial and beneficial for the Kaziranga national park.

\n\n

Why is Brahmaputra significant for Kaziranga?

\n\n

\n

- Kaziranga National Park is a 117-year-old park and a UNESCO World Heritage Site since 1985.

\n

- Every year, the Brahmaputra takes away portions of land from the Park.

\n

- Resultantly, on paper the park is 1,030 sq km in area, but in reality it is 884 sq km.

\n

- It also continues to shrink year after year.

\n

- It affects mostly hog deer, swamp deer, wild boar and other few animals.

\n

- These are those that fail to reach higher ground in time after floods.

\n

- Despite the above, Brahmaputra contributes more to, than harms, the wildlife in the park.

\n

- It gives more to the habitat of the world's largest population of one-horned rhinos.

\n

- The unique biodiversity of Kaziranga is rejuvenated by a dynamic system that connects the Brahmaputra with its alluvial floodplains.

\n

- But this year, the park has not been inundated, causing concerns for the park authorities.

\n

\n\n

\n\n

Why are floods essential?

\n\n

- \n
 - Floods have long been beneficial to Kaziranga and Assam. Click [here](#) to know more.
 - \n
 - The deluge happens up to four times a year between April and October.
 - \n
 - Unlike farmlands across the Brahmaputra floodplain, monsoon floods are essential to Kaziranga's ecosystem.
 - \n
 - Kaziranga's plant and animal life are intrinsically linked to the floods.
 - \n
 - Its vast grasslands and beels (wetlands) are revitalised annually by the Brahmaputra's overflow.
 - \n
 - The floods help deposit mineral-rich alluvial soil.
 - \n
 - This facilitates growth of grass and shrubs that are the main source of fodder for herbivores.
 - \n
 - Besides, the floodwaters, while receding, flush out aquatic weeds and unwanted plants.
