

## Landslides in Kerala

### Why in news?

The death toll from the Wayanad landslides crossed 400 and around 152 people are still missing.

### What is landslide?

- **Landslides** - They are hydro-geological hazards of mass wasting of rock falls, mudflows, shallow or deep-seated slope failures and debris flows happening over surface and sub-surface.
- **Impacts** - It leads loss of live and large scale destruction of infrastructures, properties and industries.
- It profoundly alters the landscape of the region causing loss of flora and fauna.
- It changes the course of river and divert in path.
- It forces people in the region to migrate.
- **India** - 15 % of the India's landmass is prone to landslides.
- It includes majorly of
  - Himalayas
  - The Northeastern hill ranges
  - The Western Ghats and the Nilgiris
  - The Eastern Ghats
  - The Vindhyas
- **Measure taken** - Government had formed Gadgil expert committee in 2011 and Kasturirangan committee in 2012.
- **Landslide atlas** has been prepared by ISROs National Remote Sensing Center and National Landslide Risk Management Strategy has been formed by National Disaster Management Authority.
- Monitoring by satellites like IRS-1D , Resourcesat , Cartosat , Sentinel , InSAR are used.
- River Basin specific Flood Early Warning System was developed to handle the landslide associated with floods.
- Landslide Risk Mitigation Scheme (LRMS) was started to provide financial support for landslide prone states.

### Why Kerala is prone to landslide disaster?

- **Landslide in Western Ghats** - It is characterized by a lateritic cap and steep slopes in Western Ghats in the South Konkan coast besides Nilgiris.
  - Laterite cap - Thick laterite soil cover.
- **Vulnerability of Kerala** - About 8% of the area in the Western Ghats in the Kerala is labelled as a critical zone for mass movements.
- According to the landslide atlas in 2023, 10 out of the 30 most landslide-prone districts

in India were located in Kerala, with Wayanad ranked 13th.

- **Status of Kerala's vulnerability** - Of the 3,782 landslides between 2015 and 2022, 2,239 (nearly 59.2%) were reported from Kerala.
- In 2022, the Ministry of Earth Sciences informed that Kerala witnessed the highest number of major landslides in the country over the past seven years.
- **Causes** - There are natural and man-made causes.

| Topographic factors   | Climatic factors   | Anthroponic factors   |
|---|--|---|
| <ul style="list-style-type: none"><li>• Hills and mountains</li><li>• Steeper slopes</li><li>• Thinning of soil</li></ul> | <ul style="list-style-type: none"><li>• Extreme rains</li><li>• Thicker cumulonimbus clouds</li><li>• Climate change</li></ul> | <ul style="list-style-type: none"><li>• Deforestation</li><li>• Landscape changes</li><li>• Quarrying</li><li>• Negligence by governments</li></ul> |

- **Geographic vulnerability** - Roughly 50% of Kerala consists of hills and mountainous

regions with *slopes greater than 20 degrees*, making these areas prone to landslides during heavy rains.

- **Disruption in soil cover** - Western Ghats in Kerala are marked by thick soil cover but human interventions have affected them.
- During monsoon, the soil gets saturated due to percolating rainwater, making it unstable and when the water content reaches a threshold level, the soil mass becomes weak triggering debris flows.
- **Changing nature of clouds** - The *thicker cumulonimbus clouds*, which extend up to 14 km in height and could *create sudden, short spells of heavy rain* over smaller areas, are forming over Kerala during the Southwest monsoon.
- Earlier, low-hanging, thinner clouds were usually the norm.
- **Extreme rains** - It is intensifying across India and over the Western Ghats from Kerala to Maharashtra.
- **Cyclones in Arabian Sea** - The Arabian Sea is warming at a high rate and with it, the possibility of severe cyclonic storms is rising.
- All over Kerala, the monsoon pattern has been changing.
- **Climate change** - Spells of heavy rain, which lead to calamities like floods and landslides, are a result of climate change induced by global warming.
- **Anthropogenic causes** - There is *widespread deforestation* and *denuding of hills* due to landform changes.
- **Unsustainable developments** - Unscientific construction activities in vulnerable areas also lead to disasters.
- **Deforestation** - Reduction in forest cover makes the soil in the slopes loose and increase the fragility of the terrain.
- 59% of the total landslides in Kerala occurred in plantation areas.
- **Lack of updated data** - Engineering structures are being built based on the amount of rainfall and intensity of rainfall in older days.
- **Blockage of water channels** - Small drainage channels present on the surface of the hilly areas are blocked by erecting buildings and contour bunds block their natural flow.
- During the rains, the water that percolates get concentrated leading to increased pore pressure along the channel.
- **Indiscriminate quarrying** - Such activities in Ecologically Sensitive Areas (ESAs) make the landscape unstable.
- **Misgovernance** - Measures recommended by the expert committed were neglected.
  - In 2011, Western Ghats Ecology Expert Panel led by Madhav Gadgil had had recommended that the *entire Western Ghats* be notified as ESAs.
  - The Kasturirangan committee reduced the extent of ESAs to **37%** of the Western Ghats.

### What lies ahead?

- There is a need to rethink new or added risk factors while constructing roads or culverts.
- All mountain drainage channels should be free helping easy runoff.
- Maintaining adequate buffer zones in constructing buildings on or near water channels.

- Ban on mining, quarrying and other red category industries new thermal power plants, hydropower projects and large-scale wind energy projects in ecologically sensitive zones.
- Increase the forest cover in the region with endemic species of trees.
- Reducing the population pressure on eco sensitive sensitive regions.
- Implementing the Gadgil and Kasturirangan expert committee recommendations.
- Sensitizing people, tourism and industries sector about the ecological vulnerability of the region.
- Development of landslide early warning systems.
- Capacity development of National and State Disaster Management Authorities to handle landslides.
