

Loss of soil fertility

What is the issue?

\n\n

\n

- The pressures of constantly increasing agricultural production have in turn resulted in a persistent decline in soil fertility.

\n

- This could possibly be a major challenge that Indian agriculture is currently facing.

\n

\n\n

What are the concerns with soil health?

\n\n

\n

- Soil **degradation** and **loss of fertility** is affecting the productive capacity of the soil.

\n

- The current status of **nutrient-use efficiency** remains quite low for most nutrients.

\n

- The demand for food grain is expected to increase, but with the current soil health status, meeting the targets would be a huge challenge.

\n

\n\n

What are the causes?

\n\n

\n

- Inappropriate **agricultural practices** include,

\n

\n\n

\n

1. Overuse of chemical fertilisers and pesticides on soil.

\n

2. Excessive tillage.
\n
3. Moving away from age-old organic soil revival practices.
\n
4. Unscientific rotation of crops.
\n
5. Poor irrigation and water management practices.
\n

\n\n

- \n
- Factors such as deforestation, ill management of industrial wastes, overgrazing by cattle, and urban expansion, are also the notable causes.
\n
- **Organic matter** plays a key role in maintaining soil fertility by holding nutrients to the soil. Decline in soil organic matter causes limited soil life and poor soil structure.
\n
- **Soil organic carbon** plays a key role in maintaining soil fertility, increasing water-holding capacity and even suppressing crop diseases. Inappropriate practices are resulting in low Soil Organic Carbon.
\n
- Deterioration in chemical, physical and biological health of the soils are to blame for low nutrient use efficiency.
\n
- Natural factors such as floods, volcanoes and earthquakes also contribute to shortfalls in soil health.
\n

\n\n

What is to be done?

\n\n

- \n
- Farmers and policymakers are largely responsible for ensuring safe agricultural methods.
\n
- However, the **agrochemical industry** too must react by investing and producing **organic biological products** that help rejuvenate soil health.
\n
- Making agriculture more **sustainable** by having a right balance between use of agrochemicals and age-old practices of soil regeneration.
\n
- It is the need of the hour to educate farmers on sustainable practices.
