

## **LTCG Tax on Equity is Only Logical**

### **What is the issue?**

\n\n

\n

- 10% LTCG tax has caused angst among many investors and has also contributed to the recent share market weakness.

\n

- But this move is justified as there is no need to accord preferential treatment for share capital as opposed to debt instruments.

\n

\n\n

### **Why should LTCG on Equity be taxed?**

\n\n

\n

- The recent budget slapped a 10% tax on long-term capital gains above Rs. 1 lakh on listed equity shares and equity mutual funds.

\n

- There is little logic in why equity instruments should be tax exempted, when debt instruments such as bank fixed deposits, don't have exemptions.

\n

- Notably, the latter is what forms the mainstay of the population.

\n

- Also, equity has been delivering massive gains to investors over the past few years, even as debt investors are staring at whittled-down returns.

\n

- Further, the finance minister noted that tax returns filed in 2017-18 indicate that LTCG tax could significantly boost revenues.

\n

\n\n

### **On what grounds is concept of LTCG on equity opposed?**

\n\n

\n

- Some vouch that equity has higher risks and hence deserves tax exemptions.

- \n
- Further, some reason that tax breaks will help in promoting equity instruments, which are currently still very restricted in India.
- \n
- But investors ought to know what they are getting into and align their return expectations accordingly.
- \n
- While the introduction of LTCG Tax has caused disturbance in the short-term, things will slowly but surely adjust to the new-normal.
- \n

\n\n

### **What are some of the teething issues with the current proposal?**

\n\n

- \n
- **STT** - One major complain from investors is that while LTCG tax has been re-introduced, the securities transaction tax (STT) still remains.
- \n
- Notably, STT was introduced in 2004 in tandem to replace the tax on LTCG and hence should ideally be retracted now.
- \n
- In any case, STT revenue was quite small, at less than Rs. 10,000 crores a year.
- \n
- **Inflation Indexing** - LTCG on equity is taxed at 10%, which is much lower than the 20% LTCG tax on other asset - like gold, real estate and debt funds.
- \n
- But these other assets are inflation indexed, which helps them to adjust gains by accounting for inflation effects, which helps in reducing taxes.
- \n
- As cost indexation is a fair principle that results in taxing only real, inflation-adjusted returns, LTCG on equity too needs to be inflation indexed.
- \n
- This will protect investors against high inflation risks and needs to be considered even if it means increasing the tax rate.
- \n
- **STCG Tax** - “Short-Term Capital Gains Tax” on equity (which covers stocks held for 12 months or less), is still being taxed at a mere 15%.
- \n
- This too is much lower than the tax on short-term gains on many other asset classes and hence needs to be hiked.
- \n
- **Anomalies** - While the LTCGs on equity are now taxed, capital gains on

“Insurance-cum-Investment Products” continue to be exempted.

\n

- As this would give the latter an unfair advantage and could distort the capital market patterns, it needs to be corrected.
