

Making Way for Elephants

What is the issue?

\n\n

\n

- Elephants making news for dying on rail tracks is on the rise in recent days.
- The incidents remind of the duty of protecting the forests where elephants thrive.

\n

\n\n

How is the casualty scenario?

\n\n

\n

- **Tracks** - More than 100 elephants had died on the tracks during 2001-10.
- The frequency and number of train kills have, in fact, been rising.
- Across India, average annual casualties jumped from 9 during 2000-09 to 17 over the next 7 years.
- **Others** - Trains are actually a minor killer.
- Poisoning, poaching, and electrocution together kill more than four times as many elephants.
- During 2009-16, more than 500 elephants died this way as against 120 killed on the tracks.

\n

\n\n

What is the threat?

\n\n

\n

- Only the richest and widest of forests can support elephants.

\n

- Elephants migrate long distances along 'corridors' that are usually marked by similar vegetation.
\n
- Once-contiguous elephant habitats are now fragmented by mines, rail lines and human settlements.
\n
- This largely interrupts their transit zones and lead to clashes and casualties.
\n
- Elephants thus pay a heavy price as one of the worst victims of India's development.
\n

\n\n

What are the limitations with protection?

\n\n

- India's 668 **Protected (forest) Areas** cover less than 5% of the country's area.
\n
- India's 32 **elephant reserves** (ERs) are spread over 65,000 sq km.
\n
- But only less than 30% of this area is legally protected forests.
\n
- Centre's **Elephant Task Force** recommended declaring the entire ER area as ecologically sensitive under the Environment Protection Act.
\n
- This would make another 46,000 sq km out of bounds for miners and developers.
\n
- The Task Force also recommended setting up of 10 **elephant landscapes** around the 32 ERs.
\n
- This would require **judicious land** use in another 45,000 sq km.
\n
- But there is reluctance to treat the Protected Areas as sacrosanct.
\n
- Attempts to make these stretches as **no-go zones** are seen as an impediment to growth by many.
\n

\n\n

What are the other concerns?

\n\n

\n

- National Highways run through 40 of India's 88 identified elephant corridors.

\n

- Putting **curbs** on speed or night traffic along the ever-expanding linear network makes little economic sense.

\n

- **Speed restrictions** are feasible only in short, singular stretches. E.g.

\n

\n\n

\n

- i. 11km near Berhampore in Odisha

\n

- ii. 8-km segment through Jharkhand's Palamu

\n

- iii. 4-km in the Palghat Gap in the Western Ghats that connects Kerala's Palakkad and Tamil Nadu's Coimbatore

\n

\n\n

\n

- However, speed restriction is not an option on **steep gradients**.

\n

- E.g. in Assam's Karbi Anglong, where to climb, trains must accelerate

\n

- In North Bengal, the night speed limit once applied to a total of around 17 km.

\n

- It was applied for a **series of short stretches** of 1-3 km each, in an 80-km segment between Siliguri and Alipurduar.

\n

- But since 1-3 km does not cover even the **braking distance**, trains ran slowly over the entire segment.

\n

- Slowing down trains for hours at a stretch would disrupt **rail traffic** over a large part of the network.

\n

\n\n

What could be done?

\n\n

\n

- **Speed restrictions** - This could work better when guided by real-time inputs on elephant movements.

\n

- A protocol put in place in Rajaji National Park (Uttarakhand) helped avert elephant casualties for many years.

\n

- Followed rigorously, it can be replicated in short stretches elsewhere.

\n

- **Realignment** - There are places where a track, or road, cuts across several wildlife corridors over a longer stretch.

\n

- The solution for these junctions could be realignment.

\n

- Where realignment is not possible, tracks have to be elevated with underpasses for elephants.

\n

- **Railways** - Not all forest routes can be realigned or elevated overnight.

\n

- The Railways must thus prioritise, and balance efficiency and safety while planning projects or expanding existing ones.

\n

- Expertise and experience available to find site-specific, science-based solutions for key corridors should be made use of.

\n

- **Political will** - The test lies in the will to implement those remedies irrespective of the cost.

\n

- It will take a lot more to secure the elephant's fragmented and shrinking home, such as giving up on sizeable coal reserves.

\n

- **Provisions** - Elephants mostly travel for water.

\n

- Periodic de-siltation of their watering holes will keep them in their areas.

\n

- **Besides**, WTI (Wildlife Trust of India) is testing an automated solar-powered device, **EleTrack**.

\n

- This can detect large animals near the tracks and issue a loud, flashing warning for train drivers.
