

Miyawaki Technique

Why in News?

In preparation for Mahakumbh 2025, dense forests have been developed at various locations across Prayagraj, to ensure pure air and a healthy atmosphere for the millions of devotees expected to visit the city.

- **Miyawaki Forestry** - An ecological engineering technique of afforestation, involves planting a diverse range of native tree species in a small area, which then grow into a **dense, multilayered forest**.
- **Developed by** - Japanese botanist Akira Miyawaki in 1970s.
- **Aim** - To create a self-sustaining forest, with a high level of biodiversity and to restore degraded land and combat climate change.
- **Process** - It involves planting trees and shrubs close to one another to accelerate their growth.
- Plants **grow 10 times faster** with this technique, making it a practical solution for urban areas.
- A completely maintenance-free, wild and native forest after the 1st 3 years.
- **4 steps of Miyawaki forestry technique**
 - Initial survey of the locality
 - Collection of the seeds
 - Preparation of planting sites
 - Planting

The Miyawaki method for restoring tropical forests

*Miyawaki Technique is also known as **Pot Plantation Method**.*

- **Benefits** - *Up to 30 times more dense* than conventional plantations.
- Up to 30 times better *noise and dust reduction*.
- Up to 30 times *better Carbon-dioxide absorption* as compared to a monoculture plantation.
- It is highly effective in the establishment of *urban forests* as well as converting unproductive wastelands into ecological and socially beneficial productive lands

The Prayagraj Municipal Corporation has utilized the Japanese Miyawaki technique over the past 2 years to establish multiple oxygen banks, which have now transformed into lush green forests. It also contributed to improving air quality, playing a crucial role in environmental conservation.
