

## **Need for a Coal Commission for India**

### **What is the issue?**

\n\n

\n

- With the increasing emphasis on transition to renewables, India is moving away from coal.

\n

- This calls for a coal commission for India, to devise the needed strategy and protect the livelihood of those in the coal belt.

\n

\n\n

### **What is Germany's coal commission for?**

\n\n

\n

- In Germany today, there is an existential tug-of-war between the coal industry and the country's "coal commission."

\n

- The Coal commission is formally known as the Committee on Growth, Structural Change and Employment.

\n

- It is slowly but surely setting targets for the phase-out of coal-based power generation from the country's energy mix.

\n

- The commission, a political settlement mechanism, is made up of 28 members with voting rights.

\n

- It includes trade union leaders, industry associations, academics, and regional representatives.

\n

- The commission will determine how and when coal's phase-out will occur.

\n

- Besides, one of its key objectives is to prevent massive structural unemployment.

\n

\n\n

## **Does India need a similar commission?**

\n\n

- \n
- India is at the early stages of a major energy transition.
- \n
- Within a few decades, renewable energy (RE) will become an increasing part of India's energy mix.
- \n
- But India's thermal coal base still provides over 60% of the country's overall generation and is still growing.
- \n
- More importantly, roughly 15-20 million people in the coal belt are dependent on the coal industry for their livelihood.
- \n
- The geography of India's wind and solar resources versus coal makes it clear that RE jobs will not be coming to the coal belt in large numbers.
- \n
- So there is a crucial need for a transition strategy for the coal belt, particularly in eastern India.
- \n
- It is high time that India works on a commission similar to that in Germany, for devising a strategy.
- \n

\n\n

## **What were the earlier measures?**

\n\n

- \n
- Various central government committees have been set up over the years to look into mining and energy industries.
- \n
- In the early 1970s, the Fuel Policy Committee under Sukhomoy Chakrabarty made key recommendations about the direction of Indian energy policy after the oil price shocks.
- \n
- In the 1990s, the Chari Committee made recommendations about opening up India's coal industry to private involvement.
- \n
- In the 2000s, the Hoda Committee recommended changes in India's mineral exploration environment to encourage private mining companies.
- \n
- More than a decade later, these ideas are slowly being implemented.

\n

- Finally, the Integrated Energy Policy of 2006 articulated India's energy security priorities.

\n

- It laid out a roadmap for phasing out capital subsidies and providing early support to RE.

\n

\n\n

## **How does the future look?**

\n\n

\n

- The government should consider a committee to consider the future of India's coal industry, and the PSUs engaged in this.

\n

- Companies like Coal India face no immediate threat to either coal demand or their market power.

\n

- But in the future, both these concerns will come up.

\n

- Also, the divergence in economic performance and incomes between India's states has intensified over the last decade.

\n

- So public spending and investment have become increasingly necessary in poorer states.

\n

- Notably, many coal-bearing states are also in the bottom third by income per capita - Jharkhand, MP, Odisha, Chhattisgarh and WB.

\n

- Public investments can go a long way in addressing the challenges of the region.

\n

- Evidently, PSUs have been fairly well and have continued to operate in eastern India for decades.

\n

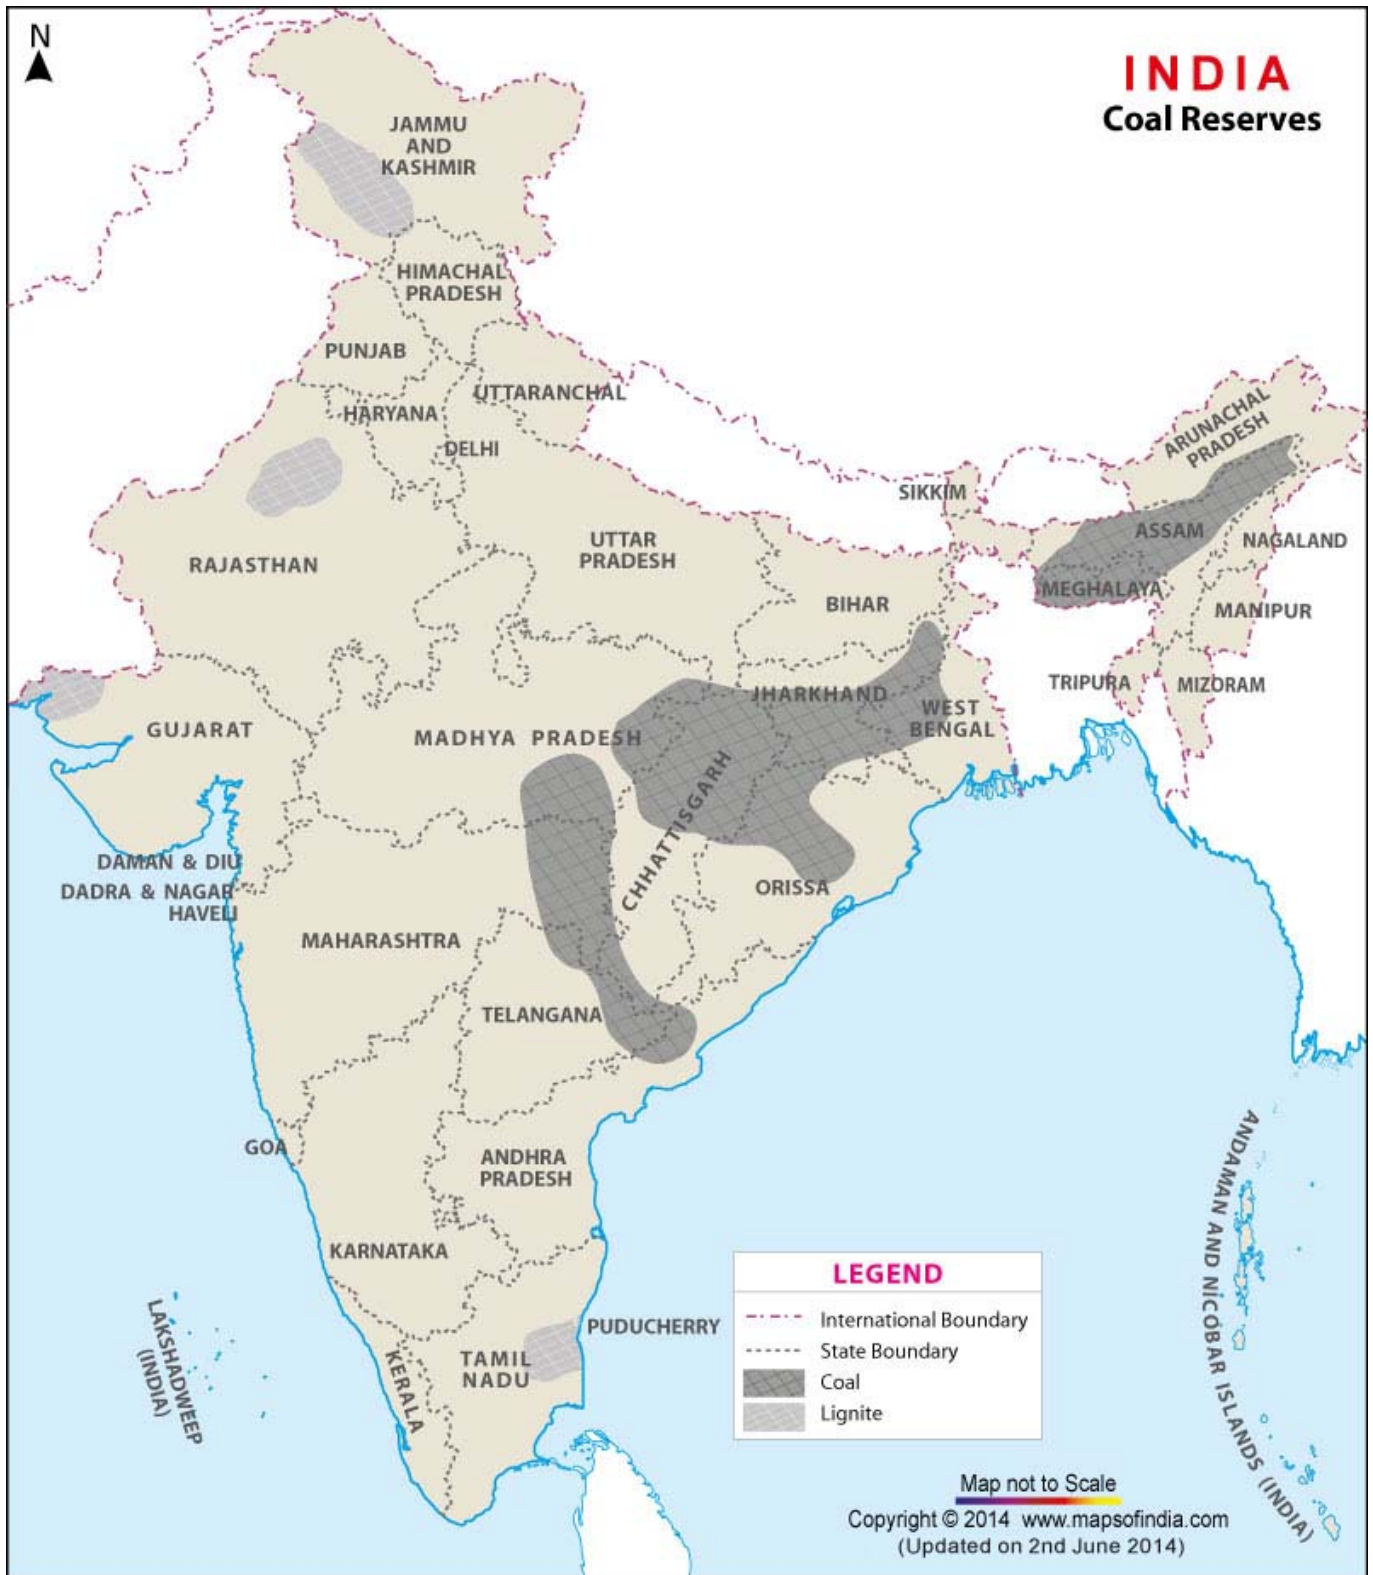

- With private investment largely evading the coal belt, PSUs like Coal India have built up considerable social and political capital in these regions.

\n

- This is despite the political complexities, adverse business environment, and infrastructural constraints in the region.

\n

\n\n

\n\n

## What are the alternative solutions?

\n\n

\n

- Indian “coal commission” can assess the feasibility of alternative mechanisms to capitalise on the potential of companies like Coal India in the coal belt.

\n

- The social and political capital that they have created can be used to lead towards other activities.

\n

- These companies could become diversified national champions as part of a new industrial policy for the coal belt.

\n

- Indian coal could be used for non-combustion purposes and the required technologies for such a transition should be adopted.

\n

- E.g. the Dankuni Coal Complex outside Calcutta

\n

- The goal of the plant was to produce piped gas for Calcutta, and various smokeless fuels and other chemical products derived from coal.
