

## Neutrino Observation

### What is the issue?

\n\n

People from several walk of life fear about the proposed Indian Neutrino Observatory project in Tamil Nadu due to lack of awareness.

\n\n

### What are neutrinos?

\n\n

\n

- The only particle other than gravitational waves that can zip through the universe at speeds very close to that of light are called neutrinos.

\n

- The biggest nuclear reactor that most life on earth derives energy from is the sun.

\n

- Like all nuclear reactors, **in addition to giving out energy (heat and light), the sun also emits neutrinos.**

\n

\n\n

### What is Standard Model?

\n\n

\n

- **All the laws and forces of nature that we know of**, other than gravitation, are described by what physicists call the Standard Model.

\n

- It predicted that neutrinos, which come under three types or flavours — **tau-neutrino, electron-neutrino and muon-neutrino** — would not oscillate from one flavour to another.

\n

- The discovery that they do meant that the Standard Model or the basic laws of physics had to be further modified.

\n

- Thus, through the neutrino detectors we are actually observing the fundamental laws of physics at the cutting edge.

\n

\n\n

## **What INO will do?**

\n\n

\n

- The proposed India-based Neutrino Observatory (INO) aims to observe muon neutrinos that are continuously produced in the atmosphere when cosmic rays strike the earth.

\n

- Since every type of matter particle has an anti-matter partner particle associated with it, there are also anti-neutrinos that the INO can observe.

\n

- Anti-neutrinos also come in three flavours and can oscillate from one to the other.

\n

- The INO, by observing the rates at which neutrinos and anti-neutrinos oscillate, will make a substantial contribution to the quest to unravel the secrets of the ultimate laws of physics.

\n

\n\n

## **Is there anything to fear?**

\n\n

\n

- There are some baseless allegations that the INO, which is just like a telescope, causes radioactivity and have compared it with the dangers of having a nuclear power plant or radioactive material in the neighbourhood.

\n

- This cannot be true since the neutrinos are very feeble and weakly interacting particles that we can't even see or feel without the help of an observatory.

\n

- Beams of neutrinos are being sent to the NOvA neutrino detector in the U.S. and to the T2K neutrino detector in Japan every day.

\n

- Moreover, being the lightest matter particles, the neutrinos do not decay

into any other particles, as everything else is heavier.

\n

- So they are not like uranium which decays radioactively into smaller atoms.

\n

- All the INO would do is to provide the lens to observe neutrinos as they are too feeble or faint to be detected by the naked eye.
