

Open Defecation and Caste Attitudes

What is the issue?

\n\n

\n

- The recently released “Health of the Nation’s States” report highlights the uneven progress made by India’s states in improving public health.

\n

- The likelihood of the average Indian falling sick due to unsafe water and poor sanitation is 40 times higher than in China.

\n

- This calls for an increased attention to the problem of open defecation.

\n

\n\n

How serious is open defecation?

\n\n

\n

- Strikingly, more than half the population of the country defecate in open fields and by the roadsides.

\n

- Resultantly, water supplies in rural India get contaminated with this.

\n

- This in turn contributes to repeated spells of diarrhoea and widespread maternal and child malnutrition.

\n

- The resulting “stunting” and “wasting” causes the tragedy of millions of Indian children growing up physically smaller.

\n

- And with inherent reduced learning abilities even before they enter the schools.

\n

- As a follow up of this is the reduced potential of workforce when these undernourished children get into the working age population.

\n

\n\n

What perpetuates open defecation?

\n\n

\n

- Some observations reveal that it was not poverty, illiteracy or a lack of water that impeded the use of toilets.

\n

- Evidently, according to the 2011 Census, about half of rural households that had no toilets had water facilities.

\n

- Similarly, in about half of households where one member has completed school, the practice of defecating outside continued.

\n

- More than 80% of countries with worse literacy rates than India's have lower percentages of people defecating outside.

\n

- In India, it is the notion of purity and cleanliness, associated with caste, that actually makes households unwilling to have a toilet at home.

\n

- The perceptions of caste hierarchy, people's roles, etc hinder communities from opting out of open defecation.

\n

- Most villagers are unwilling to close and then empty inexpensive open-pit latrines for reuse, even long after the contents have decomposed into compost.

\n

\n\n

What is desired?

\n\n

\n

- Promoting social equality is indeed a prerequisite for achieving India's goals on open defecation free environment.

\n

- Before insisting on building toilets, the social attitudes about caste and cleanliness have to be changed.
