How legitimate are leaks?

 $n\n$

\n

- Imperfections Leakers are often anonymous and the hackers who bring them out are a heterogeneous assortment of sources.
- Among other imperfections, the leaks are usually incomplete, non-specific, and have within it - false positives and risks.
- There are also palpable apprehensions that organisations like ICIJ releases only selective data sets that are in its processions.

\n

- **Risks** Leaks might be agenda driven, which precise thought given to aspects like the timing of the leak, what and how much to leak.
- \bullet High-profile leaks might also carry with them immediate political impacts and on a lesser note, serve as good fodder for trigger-happy media. \n

How does the future look?

 $n\n$

\n

- Globally, growing concentration of wealth and the inability of tax administrations to track money trails across borders has been a major issue.
- Hence, reliance on systematically collected data to eradicate tax evasion is proving ineffective and sensational leaks are likely to remain popular.
- \bullet But it remains uncertain if tax administrations, particularly in emerging economies, would actually follow the process to its conclusive end. \n
- This is because tax authorities are usually not fully independent and may

themselves suffer from pockets of corruption and political arm twisting. \footnote{Nn}

• Steady economic growth and consequent maturity in civic affairs, processes and practices are the only hope for a sustained victory against tax evasion.
