

## **Prelim Bits 20-08-2018**

### **Advanced Medium Combat Aircraft**

\n\n

\n

- It is India's next indigenous fighter and expected to make its first flight by 2032.

\n

- It is built under India's only **fifth generation aircraft** programme.

\n

- The aircraft will feature geometric stealth which is different from material stealth feature.

\n

- In material stealth, radar-absorbing materials are used to **absorb** the radio waves thus reducing the radar footprint.

\n

- Whereas, in geometric stealth, the aircraft is designed at such angles to **deflect** away maximum radar waves to minimise radar cross section.

\n

- Thus, the fighter will have low radar cross section, making it difficult for the enemy to spot it.

\n

\n\n

### **Smart Anti-Airfield Weapon**

\n\n

\n

- It is an indigenously developed light weight glide bomb, capable of targeting large enemy infrastructure, like airfields.

\n

- It was recently flight tested from Indian Air Force's Jaguar aircraft successfully.

\n

- It is an accurate bomb and is termed a precision-guided munition (PGM).

\n

- It has "Inertial navigation system" which guides it precisely to its target, typically an enemy airfield up to 100 km away.

\n

- This precisely guided one bomb is more economical than traditional free fall bombs which are less accurate.
- It has another advantage that it can release the bomb at a safer distance to enemy airfield and return without exposing itself to enemy anti-aircraft defences.

\n\n

## HELINA

\n\n

- HELINA is an acronym for “Helicopter Launched Nag” missile.
- Nag is a third generation Anti-Tank guided missile indigenously developed under “**Integrated Guided Missile Development Programme (IGMDP)**” of DRDO.
- Anti-Tank Guided Missiles are primarily designed to hit and destroy heavily armored military vehicles.
- Helina is the helicopter launch variant of Nag, that can be fired from Dhruv advanced light helicopter and HAL Rudra attack helicopter.
- It is a heavier and longer-range version of the vehicle mounted Nag missile with a 7-km range.
- Typically, a land version of Nag missile has a range of only 4 km.
- The missile is guided by “infrared imaging seeker”, that homes in on the target’s heat signature.
- IGMDP involves the development of Agni, Akash, Trishul, Prithvi and Nag missiles.

\n\n

## Hilsa

\n\n

- It is the most priced variety of fish, originates in the coastal waters of Myanmar.

\n

- It travels to the mouth of the Ganga in West Bengal, Padma and Meghna rivers in Bangladesh to lay eggs in fresh water during the monsoon.

\n

- It is a sensitive species and its breeding ground is mostly concentrated at the confluence of river and oceanic waters.

\n

- After breeding in freshwater, the fish makes its way to seawater by undertaking a return journey to the confluence points.

\n

- It belongs to the family of Clupeidae.

\n

- It is known as “King of Fish” due to its soft oily texture and mouthwatering flavour.

\n

\n\n

## **Crypto-Pegged Forex rate**

\n\n

\n

- Venezuela has recently announced a single exchange rate based on its cryptocurrency.

\n

- Petro is a cryptocurrency launched by the government earlier this year.

\n

- The President has effectively devaluated the petrocurrency by 96 per cent.

\n

- Exchange rates, salaries, pensions and prices are pegged to Petro.

\n

- Now, one petro would equal \$60 and have the equivalent of 360 million bolivars (official currency of Venezuela).

\n

- Since 2003 Venezuela has had strict currency controls, identified by economists as a major cause of its economic crisis.

\n

- It has led to hyperinflation and rendered the bolivar currency near worthless.

\n

- The International Monetary Fund has predicted that inflation in Venezuela would hit 1 million percent this year.
