

## Primary Health Care - Lessons from Kerala

### What is the issue?

\n\n

\n

- Proper systems in Universal primary health care are crucial in India for achieving Universal Health Coverage, one of the SDGs.

\n

- The experience of Kerala in transforming primary care has lessons for the country in achieving the Astana Declaration goals.

\n

\n\n

### What is the Astana Declaration?

\n\n

\n

- In October 2018, at Astana, Kazakhstan, world leaders declared their commitment to 'Primary Care'.

\n

- The Astana Declaration aims to meet all people's health needs across the life course.

\n

- This would be through comprehensive preventive, promotive, curative, rehabilitative services and palliative care.

\n

\n\n

\n

- A representative list of primary care services are provided in this, which includes but not limited to -

\n

\n\n

\n

i. vaccination

\n

ii. screenings

\n

- iii. prevention, control and management of non-communicable and communicable diseases  
\n
- iv. care and services that promote, maintain and improve maternal, newborn, child and adolescent health  
\n
- v. mental health  
\n
- vi. sexual and reproductive health  
\n

\n\n

### **What is Kerala's experience in this regard?**

\n\n

- \n
- The 'Aardram mission' in Kerala aims at creating “People Friendly” Health Delivery System in the state.  
\n
- The approach is need-based and aims at treating every patient with ‘dignity’.  
\n
- In 2016, Kerala had, as part of the Aardram mission, attempted to re-design its primary care.  
\n

\n\n

- \n
- In the revamped primary care, Kerala tried to provide the services enlisted in the Astana declaration and more, with mixed results.  
\n
- These services cannot be provided without adequate human resources.  
\n
- It is nearly impossible to provide them with the current Indian norm of one primary care team for a population of 30,000.  
\n
- So Kerala tried to reduce the target population to 10,000, but even this turned out to be too high to be effective.  
\n
- It thus suggests that providing comprehensive primary care would require at least one team for 5,000 populations.  
\n
- This would mean a six-fold increase in the cost of manpower alone.  
\n

\n\n

## What does this call for?

\n\n

- \n
- **Fund** - Most successful primary care interventions allocate not more than 2,500 beneficiaries per team.
- \n
- But the supply of more human resources would generate demand for services.
- \n
- So there would be a corresponding increase in the cost of drugs, consumables, equipment and space.
- \n
- So the commitment to provide comprehensive primary care would be meaningful only with a substantial increase in fund allocation.
- \n
- **Training** - Providing the entire set of services is beyond the capacity of medical and nursing graduates without specialised training.
- \n
- Practitioners in most good primary care systems are specialists, often with postgraduate training.
- \n
- The Post Graduate Course in Family Medicine, which is the nearest India has to such a course, is available in very few institutions.
- \n
- Kerala has addressed this challenge through short courses in specific areas.
- \n
- E.g. management of diabetes mellitus, hypertension, chronic obstructive pulmonary disease, and depression
- \n
- India has to build its capacity in this regard if it is to offer services as is planned in many States.
- \n
- **Data** - Providers have to assume responsibility for the health of the population assigned to them and the population should trust them.
- \n
- Both are linked to capacity, attitude and support from referral networks and the systemic framework.
- \n
- It will not be possible unless the numbers assigned are within manageable proportions.
- \n
- So access to longitudinal data on individuals will be helpful in achieving the link.

\n

- Thus, dynamic electronic health records and decision support through analysis of data are essential.

\n

- **Private sector** - The private sector provides primary care in most countries though it is paid for from the budget or insurance.

\n

- In India, more than 60% of primary care is provided by the private sector.

\n

- It can provide good quality primary care if there are systems to finance care and if it is prepared to invest in developing the needed capacities.

\n

- Devising and operating such a system (more fund management than insurance though it can be linked to insurance) is needed.
