

## **Privatising the Space Sector**

### **What is the issue?**

\n\n

\n

- Elon Musk's "SpaceX" and its high profile projects have highlighted the increasing significance of the private players in the space sector.

\n

- This has also opened up debates on the possible horizons of future explorations and the need for regulatory reforms in the sector.

\n

\n\n

### **What was SpaceX's latest milestone?**

\n\n

\n

- SpaceX recently launched a car into space that is headed towards the asteroid belt with a dummy strapped in the driver's seat.

\n

- The silliness has indeed managed to capture the imagination of the masses, which could be put to further advance research.

\n

- The car was launched through the reusable "Falcon Heavy" rocket (currently, the most powerful launcher) from NASA's Kennedy Space Centre.

\n

- As it is reusable, it has contributed significantly to bring down costs by enhancing launch capacity by 64 tonnes at the low price of merely \$90 million.

\n

- This project is in line with current decadal trend of the increasing role of private sector in space exploration.

\n

\n\n

### **How has the role of the private sector evolved over the years?**

\n\n

- \n
- Private sector companies have operated in the space sector since the 1980s in most of the elite space club countries.
- \n
- In India, despite the various strategic, security and regulatory constraints, a private ecosystem has evolved around the ISRO.
- \n
- But there is a substantial difference between older business models and what Musk and the new-gen space entrepreneurs have been attempting lately.
- \n
- Previously, private were merely contracting with national space agencies to build satellites and subsystems.
- \n
- Contrarily, the current trend is developing entire vertically integrated operations without licensing or purchase agreements with national agencies.
- \n
- This has also triggered diversity in ambitious targets, with Musk envisioning mass exploration and companies like Amazon envisioning space tourism.
- \n
- While most of these targets are indeed overstretched in the current scenario, and involve multiple risks, the vision does indeed hold potential sway.
- \n

\n\n

## **What are the new potential areas?**

\n\n

- \n
- Some have argued that liberalising space access to private would unleash a new leap-frog moment in technological progress like the “internet revolution”.
- \n
- Entrepreneurial energy in the sector is already starting to combine, with even start-ups competing for privately conceived projects by larger space firms.
- \n
- The rush to enhance internet connectivity for the masses is also a significant “demand oriented pull factor” for increased commercial interest in space.
- \n
- This is already driving the need to commission massive constellations of small communications satellites in the “Lower Earth Orbit”.
- \n
- Asteroid mining is also another potential area that looks promising, with scope for monetization and disrupting commodity markets.

\n

\n\n

## How has the regulatory framework shaping up?

\n\n

\n

- There hasn't been much progress in this domain as space activity is still governed by the 1967 Outer Space Treaty.

\n

- This bars state actors from militarizing or claiming celestial bodies and calls upon them to regulate all private sector activity within their borders.

\n

- Most countries including the US and India haven't yet comprehensively understood the evolving trends and regulatory reforms needed in the sector.

\n

- But Luxembourg is already envisioning as an asteroid mining hub and has passed a law passed recently to establishing the necessary legal frameworks.

\n

- This might give it the first mover's advantage and India too needs to urgently capitalise on its private sector's potential to make significant gain.

\n

- **India's Case** - India even lacks an independent body that can create a level playing field for government and private space enterprises.

\n

- But there are signs of progress, and a few months ago, the "Department of Space" had published a draft "Space Activities 2017 Bill" for public comments.

\n

- While the bill fails to take the substantially different requirements of various space-related activities on board, it is indeed a start in the right direction.

\n

- India has the public and private sector potential to exploit first-mover advantage—if it addresses the private sector space race with more urgency.
