

# **Reassessing AIDS Measures**

### What is the issue?

\n\n

Observing December 1 as the World AIDS day, it should be taken note that after 2011, the decline in new infections had not been very impressive.

\n\n

#### What are the global measures?

\n\n

\n

• Specific themes are chosen every year to drive home the messages of prevention, treatment and fighting stigma and discrimination associated with AIDS.

\n

- This year's theme is 'know your status' which signifies universal testing followed by treatment of those who are tested positive.  $\n$
- In the last 30 years, no other disease control programme has attracted such global attention as AIDS.

∖n

- Other initiatives and measures include  $\n$ 

\n\n

∖n

- i. a UN General Assembly Special Session (UNGASS) on AIDS in 2000  $_{\n}$
- ii. a UN Security Council resolution treating AIDS as a security issue  $\nphin$
- iii. a special Global Fund to finance AIDS programme along with TB and Malaria (about \$20 billion for AIDS programmes alone) \n

\n\n

∖n

- But the real game changer was the strong involvement of civil society.  $\slashn$ 

• This especially included marginalised communities like sex workers, transgender population, gay men, people who use drugs and people living with HIV/AIDS.

\n

\n\n

## How did these benefit?

\n\n

∖n

• The cumulative effect was a greatly reduced mortality due to AIDS related illnesses.

\n

- From a high of 1.5 million in 2000, it was reduced to 9,40,000 in 2017.  $\nphin$
- The incidence of HIV, the new infections occurring every year, has also registered an impressive decrease.  $\n$
- It has come down from 0.49 per thousand adults in 2000 to 0.33 in 2010.  $\n$
- But instead of going forward and ensuring the reduction of new infections, the global programme lost direction around that time.  $\n$

\n\n

# What happened thereafter?

\n\n

\n

 Both prevention of new infections and saving lives of infected people should be twin priorities.

\n

- But the emphasis has decisively shifted to  $\underline{treatment\ alone}._{n}$
- An entire spectrum of anti-retroviral drugs came into the market.  $\slash n$
- Also, donors started investing in treatment programmes focussed on generalised epidemic countries in sub-Saharan Africa.  $\n$
- UNAIDS has kept 90-90-90 as their top priority focussing on testing, treatment and viral suppression.  $\gamman$
- [By 2020, diagnose 90% of all HIV-positive persons, provide antiretroviral therapy (ART) for 90% of those diagnosed, and achieve viral suppression for

90% of those treated] n

- But somewhere in this process, the agenda of reduction of new infections among key populations lost the needed attention.  $\$
- More worryingly, the <u>legal environment</u> surrounding these populations has turned increasingly hostile.
  \n
- E.g. Same sex relations, transgender identity and sex work have all come under increasing pressure of criminalisation.
- But Global Commission on HIV and Law had emphasized that improving the legal environment alone could save up to 1 million new infections every year.  $\n$
- Moreover, access to affordable prevention devices like condoms, needles and syringes greatly suffered in the last six to seven years.  $\n$
- Funds for prevention programmes have dried up and the meagre amounts earmarked never reached the implementers.  $\n$
- Several civil society organisations that were doing well lost momentum for want of adequate financial support.
- Resultantly, prevention interventions were left in the hands of inexperienced programme managers.  $\gamman$

\n\n

# What was the result?

\n\n

∖n

- The rate of decrease of new infections started slowing down since 2011.  $\n$
- It has virtually stayed still in the last three to four years.  $\slashn$
- The cumulative decrease of new infections from 2010 to 2017 was just 18%, a little more than 2% per year.
- Global HIV incidence still stands at high 1.8 million as revealed by UNAIDS in its latest estimate.  $\n$
- Certainly, it is hard to get to the global fast track targets of reduction of new infections by 85% by 2020.

\n

- Also, logically, the goal of ending AIDS by 2030 appears much farther away.  $\slash n$ 

\n\n

## What does it call for?

\n\n

\n

- The need of the hour is hard core programming for prevention, principally focussing on populations vulnerable to HIV.  $\n$
- Prevention messages on responsible sexual behaviour and harm reduction should be taken to the masses.  $\n$
- Global managers need to advocate equitable allocation of resources for preventing new infections and treatment of the affected.  $\n$
